Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

(5)

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

Association Notes

North Hennipen County, Minnesota:—This association has been organized for nearly two years. In that time we have succeeded in placing pure-bred sires on all farms with the exception of three who are now thinking of purchasing pure-bred sires. Practically all the milk produced is sold through the Twin City Milk Producers' Association. The prevailing price is $2.40 for 3.5 per cent milk and 5 cents per point for milk testing more. Feed prices: Silage, $6 per ton; alfalfa, $20; clover, $18; mixed hay, $12; oil meal, $43; cottonseed meal, $40; bran, $22; corn and cob meal, $23; oats, $24; barley, $26. All of our members except four have silos and all except two have water systems installed. At present the members of the association are lining up to have their cows tuberculin tested.

Allen Putman, Ohio:—This association has just started. Everything looks good for a very profitable and prosperous year. During March, market milk testing 4 per cent sold for $2.30 per cwt. The condensery paid 50 cents per pound for fat and the creamery 50c. Milk retails for 12 cents per quart, butter for 50 cents per pound, and cheese for 40c per pound. Oats sold for 32c per bushel, corn, 45c; barley, 50c; middlings, $2 per cwt.; cottonseed meal, $2.20; oil meal, $2.50; bran, $2; silage, $8 per ton; good hay, $15.

Bourbon Co-operative, Kansas:—Four cows have been weeded out, three were unprofitable and one was a reactor. One member sold all his grade cows and heifers, consisting of about 26 head. Cows have shown up better in March than any month since the association started, due to the nice weather and an abundance of feed. During March, market milk testing 4 per cent sold for $2.55 per cwt. The condensery paid 56¼c per pound for fat and the creamery 40c per pound. Milk retails for 12c per quart, butter for 50c per pound, and cheese 35c per pound. Bran sells for $23 per ton; corn cob meal, $16; ground oats, $25; cottonseed meal, $30.50; alfalfa, $12; silage, $5.

North Branch, Pennsylvania:—Two Guernseys with good A. R. records found a home in one member's barn. Another member, who has made several good A. R. short time records and last year had the high milk cow in the association, purchased a bull calf whose dam as a junior two-year-old made 17.6 lbs. fat in 7 days and 14,000 lbs. of milk in a year. During March market milk testing 3 per cent sold for $3.38 per cwt. Milk retails for 13c per quart, butter 52c a pound, and cheese 31c. Hay sold for $24 per ton; corn stover, $8; corn silage, $7.50; root crops, $8; corn and cob meal, $24; ground oats, $32; linseed meal, $55; cottonseed meal, $42.50; wheat bran, $38.

Ohio Valley, Ohio:—Seven unprofitable cows have been sold and undoubtedly several more will be sold in the near future. During March, market milk testing 4 per cent sold for $2.70 per cwt. The condensery paid 49c for fat. Milk retailed for 13c per quart and butter for 55c per pound.

Clinton—Wayne County, Pennsylvania:—At a recent meeting of the association, ten members signed the agreement to have their herds tested for tuberculosis under the accredited herd plan. Four cows were sold as unprofitable and two registered Jersey heifer calves were bought. During March market milk testing 3 per cent sold for $2.10 per cwt. The creamery paid 48c per pound for fat. Butter sold for 48c per pound. Gluten cost $50 per ton; bran, $37; cottonseed meal, $48; oil meal, $48; oats and corn, $38; hay, $18—$20.

Calkins, Pennsylvania:—Seven boarder cows were sold. Six members signed up for testing their herds for tuberculosis on the accredited herd plan. During March, market milk testing 3 per cent sold for $2.17 per cwt. Feed cost: Gluten, $47 per ton; cottonseed meal, $45; bran, $38; corn meal, $34; oats, $40; oil meal, $53; hay, $15.

Southern Franklin County, Pennsylvania:—During the month, five unprofitable cows were sold. Only one grade bull is used in the association. Market milk testing 3.6 per cent sold for $2.25 per cwt. and 4c were paid for each point above. The condensery paid 40c per pound, and in addition 50c per cwt. for milk; the creamery paid 43c per pound for fat; and the cheese factory 38c. Milk retailed for 10c—11c per quart, butter 43c—45c per pound, and cheese 30c per pound. Larro sold for $53 per ton; Unicorn, $52; bran, $40; oats, $40; corn and cob meal, $20; hay, $15—$18; silage, $8.

Milton, Wisconsin:—One member started doing A. R. O. work. Five pure-bred cows and one pure-bred bull were purchased. The creamery paid 54c per pound for fat. Milk re-

tailed for 10c per quart. Feed prices: Bran, $24 per ton; middlings, $24; oil meal, $45; alfalfa hay, $30; clover and mixed hay, $20; shelled corn, $1.20 per cwt.; oats, 40c per bushel; barley, 65c.

Richfield, Wisconsin:—Our local buyers bought the second carload of gluten feed for our members. It retailed at $41. Ten cows were sold to the butcher. During March, market milk testing 4 per cent sold for $2.10 per cwt. The condensery paid 52c per pound for fat, the creamery 52c, and the cheese factory 53c. Milk retailed for 11c per quart, butter 51c per pound. Italian cheese retailed for 46c per pound and Brick cheese for 30c.

Racine and Kenosha Counties, Wisconsin:—All members but two own pure-bred bulls. During March, market milk testing 3.5 per cent sold for $2.35 per cwt. Alfalfa hay sold for $29 per ton; clover hay, $20; mixed hay, $16—$18; oats and barley, $35; bran, $27.50; oil meal, $47; cottonseed meal, $43; corn and cob meal, $20; Unicorn, $53.

Coos Bay, Oregon:—In March market milk sold for $3.84 per cwt. The creamery paid 38c—42c per pound fat. Milk retailed for 42c per gallon. Pasture cost $1.00; hill pasture, 50c; cereal hay, $20 per ton; grass hay, $25; clover hay, $30; corn silage, $10; potatoes, $10; alfalfa hay, $29—$30; cocoanut meal, $30—$40; rolled barley, $50.

West Branch, Pennsylvania:—Three unprofitable cows were sold and one herd was tuberculin tested. Another member purchased a pure-bred herd sire. The association purchased a carload of cottonseed for $48.50. During March, market milk testing 4 per cent sold for $2.20 per cwt. The creamery paid 43c per pound for fat. Milk retailed for 10c per quart and butter for 50c per pound. Cottonseed meal cost $2.42 per cwt.; linseed oil meal, $2.50; wheat bran, $2.20; corn and cob meal, $1.10; ground oats, $1.54; mixed hay, $18.50 per ton; silage, $6.

Ringoes, New Jersey:—During March, market milk testing 4 per cent sold for $3.08 per cwt. Milk sold for 15c per quart and butter for 40c per pound. Corn sold for $25 per ton; oats, $40; wheat bran, $35; gluten, $50; oil meal, $50; cottonseed meal, $41.

Butler Road, Ohio:—This association is one hundred per cent in pure-bred sires. A calf club is being organized. During the past month six cows were weeded out. Market milk testing 3.5 per cent sold for $3.20 per cwt. Five cents were paid for each point above. Corn sold for $20 per ton; bran, $24; oil meal, $42; mixed feed, $32—42; oats, $2.25 per cwt.

Whitehall, Wisconsin:—During March, 6 unprofitable cows were sold and one pure-bred Holstein bull was purchased. The creamery paid 51c per pound for fat. Prices of feeds: bran, $26 per ton; shorts, $26; mixed hay, $15; oil meal, $45.

Western Shawano County, Wisconsin:—L. R. Shauger of Marion is running 6 cows on seven-day test. Three more herds have been tested for tuberculosis. The Senaca Brown Swiss Farm purchased the junior champion sire at last year's National Dairy Show to head the herd. Market milk sold for $2.20 per cwt. The cheese factory paid 60c per pound for fat. Butter sold for 50c per pound and cheese for 25c. Hay sold for $15 per ton; bran, $32; oats, $40; gluten, $42.

Eureka, Wisconsin:—Twenty-one cows are in the quality list for March, producing an average of 51.8 lbs. butterfat. Mr. H. L. Ellis' herd of six cows has been working hard this month, milking every six hours most of the month. This herd averaged 1,525 lbs. of milk and 53.97 lbs. of fat for last month.

The *No. 2C Autographic*
KODAK, Junior

equipped with
Kodak Anastigmat
f.7.7 lens and Kodak
Ball Bearing shutter

$25.00

This Camera fits into a niche, all its own. The size of the picture it makes, 2⅞ x 4⅞ inches, is particularly pleasing; is almost up to the full post card size—and yet the camera itself is small, light, convenient.

The Kodak Anastigmat lenses are made to exactly fit Kodak requirements. They are not merely an adaptation of a lens to the Kodak. They are a Kodak product designed to fit Kodaks, and in each case designed with particular reference to the size and type of Kodak and Kodak shutter that they are to be used with. The *f*.7.7 lens used on the *2C* Kodak has more speed than the best of the rectilinear lenses and is at least equal to the best anastigmats in depth, sharpness and flatness of field.

The Kodak Ball Bearing shutter has speeds of 1/25, 1/50 and 1/100 of a second for "snap-shots", has the usual time and "bulb" actions for prolonged exposures. It is an unusually reliable shutter, works smoothly and is quiet in its action.

The No. 2C Junior is covered with genuine grain leather, is finely finished in every detail, is extremely simple in operation, is "autographic", of course and, with the Kodak Anastigmat lens, produces negatives having that crispness and sharpness that are characteristic of the true anastigmat.

The price, $25.00, includes the excise war tax.

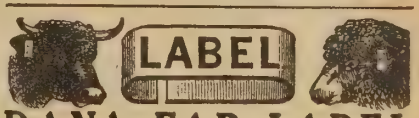
EASTMAN KODAK COMPANY, ROCHESTER, N. Y., *The Kodak City*

A Year Ago and Now

About a year ago I was approached on the subject of joining the Bear Creek, Wisconsin, Cow Testing Association. After some talk I said, "Go ahead. If you can shoot in forty or fifty dollars, I can too." We organized in April, 1920, and they elected me secretary. I did not think much more about it until the tester came to my place the first time, but when I saw him at work I commenced to wake up. I had two cows that had freshened about three weeks before that and both of them had heifer calves which I intended to sell for veal. After the test was made I saw that those two cows were making more butterfat for the month than any of my other cows, so I decided to keep the calves and took interest enough to weigh the milk from each cow in my herd. Those two cows are at the top of the pile for the whole association. You may ask what about those two calves. Well, if you have $300 you might get them, but not for less, even though they are grades.

Does testing pay well? I say yes.



Wisconsin. ALBERT SCHOELKOPF.

Official Testing in Oregon

One hundred nine dairy herds are on official test in the state of Oregon. Sixty-seven of these are Jerseys, 14 Guernseys, 13 Holsteins, 6 Ayrshires, and 2 Shorthorns. A total of 464 cows are being tested.

In my opinion, the greatest contribution which this generation can make to the progress of dairying will be to place the industry by co-operation upon a sound business basis, so that the producer will have greater control of the market for dairy products.—E. S. BRIGHAM.

Unique Milk Advertising

At the third annual Waukesha County, Wisconsin, Dairy and Agricultural show in March, 1921, a committee was appointed to handle the advertising of dairy products in the county. Arrangements were made for exhibits of dairy products in the windows of a number of stores in Waukesha. This gave the people of the city an opportunity to know something concerning the relative food value of dairy products, especially milk. Motion picture films have been exhibited to show the different phases of dairying which are educational to city people.

For two years the Holstein and Guernsey breeders have been giving milk away at their display booths at the county dairy show. At all breed association picnics and banquets, an abundance is served to guests. This year a new advertising idea is being tried out. At the show in March, a booth was made attractive with dairy posters and charts and those coming to the booth were asked to sign the "Roll of Honor" which was, in substance, a dairy pledge. A card was given each, on which was printed, "No Dairy Substitutes Used in this Home". This is made so that it can be hung in the window of the home as were the Red Cross and Liberty Loan posters. Over a thousand names were secured—no one refusing to sign the pledge or refusing to take the card. Now these cards are being displayed in the farm homes in Waukesha County.

President Harding to Recognize Agriculture

President Warren G. Harding on April 20 received a committee from the American Farm Bureau Federation. The president told the committee that he was already committed in favor of recognizing agriculture in appointments to important federal boards and commissions. The Farm Bureau leaders asked specifically that a farmer be appointed to the Interstate Commerce Commission and the President replied that the appointment would be entirely satisfactory to the Federation. The President also stated that he would consider with favor the appointment of farmer-minds on the Federal Reserve Board, the U. S. Shipping Board, and other boards and commissions.

Another Tuberculosis Ruling

The legislature of Washington has recently enacted legislation providing that all cattle over one year of age must be tested for tuberculosis and receive a certificate of health at least six months before being exhibited at fairs in the state. No entry for showing can be accepted by any fair or exhibition unless it is accompanied by a certificate of health. A penalty clause provides for a fine of not less than $50 or more than $200 for exhibiting animals in violation of this provision.

$106,000 Bull Dead

Carnation King Sylvia, the Holstein bull for which the Carnation Stock Farm paid A. C. Hardy of Canada $106,000 at the National Holstein Sale in 1918, is dead. This famous sire was but three and a half years of age when pneumonia caused his death. Insurance totalling $50,000 was carried.

Carnation King Sylvia had been used on the daughters of Matador Segis Walker and had sired 91 calves. Forty-nine are retained on the Carnation Stock Farm, the others having been sold into fourteen states and two foreign countries.

"The 1921 Briscoe Is the Best Car Built Today"

Thousands of farmers have welcomed the Briscoe statement and challenge to any car for a comparative test. It says something and means something—it gives the buyer a chance to get down to hard facts.

You'll find the Briscoe motor stretches a gallon of gasoline further than you would have thought possible. 20-25 miles, and even better is a common record among owners. Power to take you anywhere and back.

Briscoe long flat springs take all the bumps out of the road; and coupled with Briscoe light weight they mean extra-long tire life.

In sturdiness, style and comfort, the Briscoe is the ideal car—and any Briscoe dealer will gladly prove it.

"Filled Milk" a Health Menace

Cocoanut Oil Cannot Substitute Milk Fat

SPEAKING before the Wisconsin Assembly Committee April 21, Dr. E. B. Hart of the Wisconsin Experiment Station declared "filled milk" to be a health menace and that the substitution of cocoanut oil for butterfat in milk "is a thing that the public should not tolerate". He stated that the skimmilk going into the imitation product has less than one-tenth of the vitamine content of whole milk and that the cocoanut oil added is almost altogether lacking in this growth essential.

The following is Dr. Hart's testimony as presented:

The traffic in substitutes in the animal and human dietary became prominent during the war. This substitution, however, only extended to the cereal grains, and, on the advice of nutrition experts, barley or corn was substituted for wheat. This advice never extended to milk products, and to substitute a vegetable oil such as cocoanut oil for butterfat has never met with the approval of those who understand nutrition problems. Today there is considerable traffic in the manufacture and sale of a filled milk, that is, a milk from which the butterfat has been extracted by centrifugal processes and in which a cheaper fat, mainly cocoanut oil, has been substituted. One of the prominent brands of filled milk on the market is "Hebe". The buying public is just as likely to buy a can of this condensed filled milk as it is a can of condensed whole milk, unconsciously expecting that it is buying materials of equal nutritive value. On this latter point—equal nutritive value—science has gone far enough to give us undisputable facts and these facts I want to present in this short discussion.

The main difference between the two products, evaporated filled milk and evaporated whole milk, is the content of fat soluble vitamine. This vitamine is recognized as just as essential for growth and maintenance of an individual as is protein or a balance of mineral salts. In its absence in the dietary, the animal's growth is suspended with the manifestation of a diseased condition of the eyes. The ultimate effect is blindness with sudden death, often complicated with respiratory troubles. A few years ago, before we knew much about the distribution of this vitamine and before our methods of experimentation were as well perfected as they are today, the statement went forward from this laboratory that separator skimmed milk contained about one-half or fifty per cent of the fat soluble vitamine originally contained in the whole milk. In other words, that about fifty per cent had been removed with the removal of the fat. Today we know that this figure is too high for the content of this vitamine in skimmed milk. With refinement in our experimental procedure Dr. Steenbock has shown that the fat soluble vitamine content of skimmed milk is less than one-tenth of that which was originally present in the whole milk. In other words, probably over ninety per cent of the fat soluble vitamine in whole milk has been removed in the skimming processes. This fact makes skimmed milk a poor source for the fat soluble vitamine. When rats are fed a ration which is practically free from fat soluble vitamine, ten c. c. of skimmed milk will not induce normal growth, while one-half to one c. c. of whole milk will induce a normal rate of growth. The basis then for objection to a traffic in filled milk rests upon the scientific fact that skimmed milk, which is the basis of this product, has been robbed very largely of one of its great essentials of nutrition.

The next outstanding fact derogatory to a filled milk as being of equal value to a whole milk in this: the cocoanut fat or oil which is added is in itself practically free from the fat soluble vitamine. It, like practically all other vegetable oils, is so free from this nutritive factor that it is difficult to establish whether it contains any fat soluble vitamine.

These two facts—low content of fat soluble vitamine in the skimmed milk and the addition of an oil practically free from this nutritive factor—must make it clear that filled milk is no substitute for whole milk in the nutrition of infants or of children. It may be argued that there are a number of foodstuffs that do not contain vitamines, such as polished rice, lard, bacon fat, etc., but none of these products enter into the dietary in competition with whole milk. Whole milk in the nutrition of the young stands in a class by itself as a great protective food, and any attempt to substitute something inferior, such as filled milk, is to traffic in human lives for monetary gain. Further, it may be argued that filled milk is a wholesome food product. That, we do not dispute; but we do most emphatically insist that it is not the equivalent of whole milk—the thing with which it competes on the market. Further, it may be argued that cocoanut oil is just as digestible as butterfat; that cocoanut oil has just as many heat units in it per gram as butterfat. These statements again we do not deny; but is a long exploded theory that heat units and protein are the sole factors in making up human diets and animal rations.

There is a bill before the Wisconsin legislature which if passed aims to prohibit the manufacture and sale of filled milk in the state of Wisconsin. This bill should pass if for no better reason than that an uninformed public is just as likely to buy the substitute as it is to buy the genuine article, namely, the evaporated whole milk. The nutrition of the American people should always be liberal. *For direct consumption we should never allow as valuable a product as whole milk to be in any way tampered with.* The condition into which the people in Middle Europe sank during the war in respect to their nutrition ought to make us emphatically insistent upon the use of a liberal dietary for ourselves and our children. The substitution of the inferior cocoanut oil for the superior butterfat in a product like milk is a thing that the public should not tolerate for one moment.

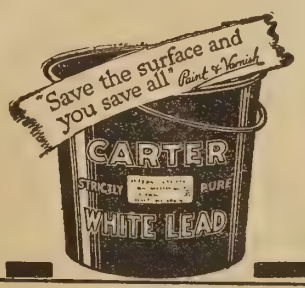
Youngstown Milk Campaign

The National Dairy Council reports that another milk and dairy products campaign is under way at Youngstown, Ohio, this being put on by the co-operation of the following local organizations of Youngstown: Federation of Women's Clubs, Public Schools, Community Corporation, Chamber of Commerce, Red Cross Organization, Boy Scouts, Allied Council of Social Agencies, Youngstown Board of Health, and Federation of Churches.

Seed time is again with us, and we all know that if we do well our part kind Nature will never fail us in our needs.

8 Gallons of Pure Lead and Oil Paint

will paint this house—22x28 with 18 ft. posts—two coats with probably enough paint left over to touch up anything else that needs it.



To make this paint requires:

100 lbs. CARTER WHITE LEAD
5 gal. Linseed Oil
1 qt. Drier (if raw oil is used)

Usually some turpentine is used in the paint for the first coat and colored paint is made by adding tinting colors ground in oil.

CARTER WHITE LEAD and these other ingredients of pure paint may be purchased nearly everywhere paint is sold at retail and the dealer will cheerfully help you to figure out how much paint will be required for any painting you wish to do and what it will cost ***at this year's reduced prices.***

You will find everywhere that the cost of this pure paint is so reasonable that you cannot afford to postpone any needed painting. You will also find **CARTER WHITE LEAD** so easy to thin and spread, to cover so well and to wear so long that you will always be glad you read and acted on this advertisement.

Primrose Prices Reduced
See Your International Dealer!

IN the unequalled success of American dairying the Primrose Cream Separator has played a prominent and deserving part. The Primrose is today the highly perfected result of many years' improvement and betterment. In design and workmanship it is a quality product entirely worthy of the 90-year manufacturing record of the Harvester Company. *With the present price reductions,* Primrose will help more and more farmers to a realization of maximum profit.

Dairying yields the utmost in final results when a Primrose Cream Separator handles the milk. The efficient record of tens of thousands of Primroses in the hands of individual owners makes that statement authoritative. Study the Primrose and take advantage of Primrose lower price at the stores of the International dealers.

THE AUTO-OILED AERMOTOR
A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

A year's supply of oil is sent with every Aermotor

Stanley's CROW REPELLENT

Dairy Prosperity in Friesland

(Continued from page 661)

of the butter and cheese is made in the 88 co-operative creameries with over 14,000 members. From May, 1917, to May, 1918, 440,000 tons of milk were delivered from which the farmers received 17½ million dollars, the working expenses amounting to about four million dollars. The value of butter made was slightly above that of the cheese made.

The Creamery System

The creamery at Marrum built in 1916 at a cost of $24,000, equipped with modern machinery, was a model of system and cleanliness. This organization had been going on for 30 years, having 200 co-operators with 1,600 cows at the present time, although they had 2,000 before the war. Each member was held equally responsible for the debt assumed to begin business, but the votes are in proportion to the number of cows until a certain limit is reached. Ten per cent of the buttermilk and 17 per

COMING HOME FROM MARKET

cent of the whey is returned free to the farmer by the driver who brings the farmers' milk twice each day. As soon as the milk reaches the creamery that which is to be used for making butter is pasteurized by the flash method, while most of the remaining part goes into the cheese vat, a part going to Amsterdam after being pasteurized to be sold as market milk in certain seasons of the year. About 40 of the creameries have established a factory at Leeuwarden where whole and skimmilk are condensed and made into milk powder when there is a surplus of these other products.

Butter is made the second day and is of excellent quality. It contains but 14 per cent moisture. For export trade it is packed in 100 lb. casks like the Danish butter and the most of it goes to England. Cheese is made full cream and partial skim. The percentages of fat content used were 10, 20, 30, and 40. All of these products bear the government stamp and are subject to careful inspection. In the co-operative dairy at Leeuwarden, a market milk plant was being operated. Pasteurized and bottled milk was selling at about seven cents per quart, but most of the milk was sold raw by the bulk at little more than four cents. To the rear of the building were kennels for the eight or more pairs of dogs which draw the milk carts about the city.

Here was also a rennet and butter color factory owned by the co-operative creameries, thus insuring good quality products for their own use and commanding an outside sale at a profitable price. The enterprise which was shown with the greatest pride was the co-operative cheese warehouse which handles the products of the creameries and is said to be the largest in the world, having a capacity of two million. Fifty thousand are brought in each day, some coming by rail but most of them by the canal boats which unload at its door. Here the cheese is graded, some of them painted and allowed to finish the curing process. The humidity and temperature may be regulated according to the style of cheese and where it is to be sold. Agents are kept in all cheese buying countries to dispose of their product. Here are round red Edams, Cheddars, Goudas with their bulging sides and Friesland, the shape of Cheddar but flavored with cloves.

There was cold storage space for butter, about 44,000 lbs. being brought in daily. Most of the butter is sent out in a few weeks and considerable is tinned here to be sent to the tropics. It was said that the wholesale cost of handling the cheese and butter was about one per cent of the wholesale price.

Co-operative Banking

For seven years the creameries have maintained a co-operative bank, starting with 40 members and now having 76 with an increase of 12 times of the business transacted. Interest paid on yearly deposits is 4¼ per cent and on other deposits 3½ per cent. Money is loaned at 5½ per cent. All sorts of banking business are conducted here. There is no capital, the creameries being jointly responsible. Of quite another sort are the 89 rural co-operative banks which together number nearly 8,000 members. These are savings banks and loan money only for farm operations.

While dairying is the main interest of the country, co-operative activities extend to all lines. There are a number of slaughter houses, one having 2,000 members; a sugar beet factory and a number of potato starch factories; a distributing plant for feeds and fertilizers and one for the marketing eggs and poultry. This latter has about 10,000 members and before the war did a business amounting to three-quarters of a million dollars annually. During the war the poultry business suffered a severe setback here as in all of the countries of Europe and this year the business will hardly be half of the prewar average. Eggs are brought here within a week after they are laid and then marked with the member's stamp. Here they are candled, the society mark placed upon them, then graded according to size, and then placed on the market within a short time.

Poultry is placed in cold storage until the best market is secured. Eggs are never placed in cold storage but every year 200,000 are pickled in water glass. A pickled egg sells for about one cent less than a fresh one. No eggs have been exported since 1914, as has been the case with bacon. This association, which has been organized for 17 years, during the last five years has sold mixed poultry feed to its members. Up on the top floor were bins holding barley, cracked corn, peas, and wheat. Chutes led to an automatic mixing machine with a daily capacity of six tons. The society was helping their members restock their roosts by the hatching of

HOME OF J. WASSENAAR WHO OWNS SOME OF THE FINEST SHOW CATTLE IN FRIESLAND

several thousand chicks in electric incubators at the plant.

The Friesland Agricultural Society, with a membership of nearly two-thirds of the farmers in the province, has looked out for their interests during the last 70 years and at the present time have a building in Leeuwarden where their headquarters are located. "I believe the ten-hour day for agricultural laborers is coming here in Friesland," said N. H. Blank, the secretary of the information service. "With the control of the government exercises on food products influencing the prices combined with a governmental fixed ten-hour day, the farmers will ask that the rates of rent be fixed by law. Altogether the farmers have been very well off the last few years. Prosperity has not injured cooperation but, on the other hand, has strengthened it. Our farmers are well informed on agricultural questions. There are 80 to 90 short courses held in the province each year and our agricultural high school supplies many leaders for our enterprise."

Tuberculosis Eradication in Kansas

HOARD'S DAIRYMAN:—For the first time in the history of Kansas, tuberculosis among cattle will be fought with county-wide concerted action here, beginning May 1, when the breeders of Sedgwick County will undertake the task of doing away with tuberculosis in the county. The project was decided upon and mapped out April 17 when more than 100 farmers and stockmen gathered in Wichita to talk over an anti-tuberculosis drive.

The fight began May 1, and will continue until Sedgwick County livestock is free from tuberculosis and then the county's boundaries will be a quarantine line against possible incoming tuberculous cattle, according to the general sentiment of the breeders present.

The outside speakers who addressed the gathering were J. H. Mercer, State Live Stock Commissioner and H. M. Graefe, federal examiner in charge of tuberculosis eradication in Kansas.

It was the sentiment of the farmers that a county-wide clean-up this year followed by rigid and regular inspections would be cheaper for the county and for the breeders in the long run than the former policy in which the anti-tuberculosis fight was left to the choice of each breeder.

Those breeders who have had their herds under government supervision for some time are enthusiastically in favor of the project and will give it solid support. Others have expressed themselves in like manner.

Kansas. D. STALLARD.

An Old Granny Remedy for Garget

Mr. C. A. Handley of Maine sends us the following remedy for garget which he has tried out and has never known it to fail. He calls it an old granny remedy, and says, "This remedy looks so simple that I presume it would be hard to make any of your readers test it".

The remedy proposed by Mr. Handley is as follows: take one quart of beans, boil until soft and mash them up in the water in which boiled. To this add bran to make a mash, adding a little salt to increase its palatability. If the first feeding does not overcome the trouble, repeat in 12 hours." He states that he has never failed in securing a complete cure in 24 hours.

Give the neighbors a real treat and make the backyard as attractive as the front.

"The milker saves two hired men. We are saving $150 a month now." —ED. GRIESEMER.

How Much Would Perfection Save You?

MANY Perfection owners save enough in a year to pay for several first class dairy cows. Most owners save enough on wages in less than a year to pay for their machines. Wouldn't you be interested in knowing how much Perfection would save you?

One man with a Perfection does the work of three hand milkers. With the Perfection you can easily milk 24 to 30 cows in an hour. How many men do you use in milking and what's your hourly average? Take your pencil and figure out the time and wages Perfection would save you in a year. Worth while isn't it? You are paying for a Perfection right along—why not have it?

Best of all, cows like the Perfection and users will tell you it has increased the milk flow in their herds. Cows can't distinguish the natural and gentle actions of the Perfection from that of the calf.

Find Out More About Perfection

Write for your free copy of, "What the Dairyman Wants to Know." It answers every question about milking machines. Why Milk By Hand? It's wasted energy.

DAIRY MARKET NEWS

Spring Slump Starts in Butter Markets

[Report by U. S. Bureau of Markets.]

For several weeks now butter markets have been nervous and jumpy in anticipation of the usual spring break which comes at the opening of the season of flush production. Consumption of butter has been exceptionally heavy this year even at high prices, but sentiment on the part of the wholesale and jobbing trade has been weaker of late than the supply and the good consumptive demand have warranted. There has been some question as to when the flush of production may be expected, but at the close of the week ending April 23 the consensus of opinion was that the real increase had started.

The report of the Association of American Creamery Butter Manufacturers shows an increase for the week ending April 16th of 3.7 per cent as compared with the previous week, and of 25.6 per cent as compared with the same week last year. This report covers the output of 81 factories. Present stocks of Danish butter at New York are said to be down to about 5,000 casks. Offerings of Danish for shipment on the Frederick VIII, which sailed Friday, were made at 41c c. i. f., but this price was not attractive to importers.

A few lots of butter now on the market show onion and garlic flavors. Body is also defective on some lots due to part grass feed. Some mold is beginning to make its appearance and shippers might well take special precautions against this fault from now on as losses from this cause can be easily avoided. A circular on mold prevention may be had upon request to the U. S. Bureau of Markets, Washington, D. C.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending April 23, 1921, and the corresponding week a year ago were as follows:

	Week ending April 23 1921	1920
	Cents	Cents
New York	44.8	75.5
Chicago	44.2	64.6
Philadelphia	46.3	74.8
Boston	45.6	69.8
San Francisco	34.0	56.5

The receipts of butter at these markets were 8,988,900 lbs. as compared with 6,696,371 lbs. a year ago and 8,730,577 lbs. a week ago.

Depression Features Cheese Markets

[Report by U. S. Bureau of Markets.]

Prices in cheese markets continued their downward tendency during the week ending April 23, but in spite of this fact, trading was dull and listless and market conditions at the close were more critical for wholesale dealers at primary markets than at almost any time this year. Many dealers characterize the market as demoralized, and can see no signs of relief until prices hit the very lowest point.

Some complaint is heard that retail prices have been kept too high with the result that consumptive demand has been lacking at the time when it was most needed. Reductions in retail prices have been made in some markets, but it is too soon to notice any reaction.

There was an export demand at New York during the week, and several thousand boxes were moved. Further export shipments were also made on consignment. Large styles of New York and Wisconsin cheese were practically cleaned up by Canadian buyers, presumably for export to England, but none of this business served to strengthen the weak markets.

The average wholesale prices on American cheese (style Twins) for the week ending April 23, 1921, and for the corresponding week a year ago, were as follows:

	Week ending April 23 1921	1920
	Cents	Cents
New York	28.0	29.5
Chicago	17.6	28.2
Boston	21.3	30.5
San Francisco	16.6	24.0
Wisconsin	17.1	28.3

The receipts of cheese at these markets were 3,137,862 lbs. as compared with 1,974,556 lbs. last year and 3,077,403 lbs. a week ago.

New York Butter Market

New York City, April 26:—With the market weak and yielding, it is difficult to realize that one year ago today, the quotation on extras was 71c. Of course, that high quotation was the result of the strike on the railroads which was in full force at that time. However, butter values are lower than was expected at this date. It now seems that normal prices so far as butter is concerned will obtain during the storage season. Extras at present are quoted at 39½@40c. As the storage season is as yet several weeks off there is ample time for prices to yield before speculators begin to put their usual supplies away for winter.

There are no indications that further shipments of Danish butter will be forthcoming for some time. There continues to be a strong demand for Danish butter on the part of England and France. Recent reports from England state that a price equivalent to 50@51c is being paid for Danish butter in wholesale lots in that country.

While conservative dealers fully expect to see a constant downward trend to butter prices during the next few weeks, it is undoubtedly true that the Jewish holidays, which are now being celebrated, are responsible to a great degree for the marked downward tendency at present. In the city of New York there are nearly two million Hebrews. During the Jewish holidays, the buying of food products is greatly curtailed by that race for the time being. With the Jews out of the trade, and a high percentage of butter jobbers and retailers belong to that race, the effect is immediately apparent. However, it is not expected that there will be any revival of interest in the

Straw:—A fair demand for straw at steady prices continues at Baltimore. Due to the light receipts at Chicago there is a moderate demand. New York reports straw as extremely scarce. Because of the opening of the Latonia, Ky., racing season Cincinnati expects an urgent demand for rye straw. Quoted prices are: Wheat straw—$11 Chicago, $12 Cincinnati, $8 Omaha, $18 Philadelphia, $15 Pittsburgh, $14-$14.50 Baltimore, $16 Buffalo, $17 Chattanooga, $8 Oklahoma City; oat straw—$12.50 Chicago, $12 Cincinnati, $9 Omaha, $18 Philadelphia $15 Pittsburgh, $8 to $8.50 Kansas City, $15.50 to $16 Baltimore, $16 Buffalo, $17 Chattanooga, $9 Oklahoma City; rye straw—$13.50 Chicago, $18 Cincinnati, $19 Philadelphia, $15.50 Pittsburgh, $19-$20 New York, $17 Baltimore, $16 Buffalo, $17 Chattanooga.

market with the revival of the Jewish trade as the season is now too far along to expect any upward trend to prices.

The aggregate decline in butter prices during the past week has been 5½c. On Wednesday of last week, prices advanced ½c, extras being quoted at 46c. A marked weakness in the market became apparent on Thursday and from that day prices have constantly declined. The decline on Thursday was ½@1c, on Friday 1c on Saturday 3½c, on Monday ½c, and today ½c. While there was a considerable strength in the market this morning the report from Chicago stating that the quotation in that city had declined practically 5c caused dealers to be wary with the result that there was little action in the market. The market closes weak and inactive and with indications that values will be still lower tomorrow. Established quotations today are: Extras (92 score), 39½@40c; higher scoring than extras (93 score or higher), 40¼@41c; firsts (90—91 score), 38½@39c; firsts (88—89 score), 36@38c; and seconds (83—87 score), 30@34c.

W. B. LIVERANCE.

Dairy Markets

CHICAGO, April 29—Butter—Creamery, extras, 35c; dairy, firsts, 26@33½c; seconds, 20@25c.

Eggs—Ordinary, 18@19c; firsts, 21½@22c.

Cheese—Twins, 18@19c; Young Americas, 21c.

MILWAUKEE, Wis., April 29—Butter—Creamery tubs, 36c; prints, 37c; extra firsts, 33@35c, firsts, 30@32c.

Eggs—Miscellaneous receipts, country candled, cases included, 22½@23c; cases returned, 21½@22c; seconds, 19@20c; checks, 18@19c.

Cheese—Twins, 15@15½c; Daisies, 15½@16c; Young Americas, 14½@15c; Longhorns, 14@14½c; Brick, 17½@18c; Limburger, 27@28c; Swiss, loaf, 48@50c; block, 30@31c.

SHEBOYGAN FALLS, Wis., April 26—On the Wisconsin cheese exchange at Plymouth on Monday 21 factories offered 3,276 boxes of cheese. All except 1,200 Daisies sold as follows: 1,500 boxes Daisies at 15c; 350 boxes double Daisies at 14c; 100 boxes at 14⅝c; 35 cases Young Americas at 14c; 325 cases Longhorns at 13½c; 100 cases at 13⅝c; and 116 boxes square prints at 15⅛c. The prices show another sharp decline from a week ago of 1¾c on Daisies, 2¼c on double Daisies, 2¾c on Young Americas, 2½c on Longhorns, and 2⅛c on squares.

NEW YORK, April 29—Cheese—Easier; state milk, common to specials, 15@29c; skims, common to specials, 5@18c.

PHILADELPHIA, April 29—Butter, lower; western creamery, extra, 41c; nearby prints, fancy, 51@53c.

Cheese—Weaker; Longhorn held and fresh, 19@21c.

Oregon Dairy Notes

HOARD'S DAIRYMAN:—After considerable discussion the milk men of Portland who provide milk to be sold in the public schools have agreed to provide milk that shall test 4 per cent butterfat. A campaign in favor of this action was started by W. F. Woodward, a member of the school board who objected to poor milk or milk of low butterfat content being served.

The resolution which was finally adopted follows: "That it is the sense of this meeting that fresh milk offered for sale and intended for consumption in our public schools should carry a butterfat minimum of not less than 4 per cent."

The milk stations of Portland were started in the schools last year and are proving a popular feature. Several districts by giving entertainments have raised substantial sums to carry on the work. Chi Omega, a national women's sorority, gave a ball and raised over $200 which is being used to supply milk to undernourished children. The girls weighed every child in the school before starting the milk station. The teachers all state that serving of milk greatly increases the efficiency of the children. The general plan was instituted by Edith Knight Hill when she was secretary of the Oregon Dairy Council. The present management is carrying on the work.

⚜

Portland, Ore., has another merry milk war. The Oregon Dairymen's League is selling milk to the grocers at a figure that allows them to sell it to customers at 11 cents per quart. The movement is very popular among the housewives. Mrs. Alexander Thompson, president of the Portland Federation of Women's Organizations, is out speaking for the economy crusade. J. D. Mickle, former dairy and food commissioner, is helping the league in its efforts to reduce the price to the consumer by encouraging the housewives to get the milk at the grocery stores, saving delivery costs.

⚜

The Oregon Dairy Council under the new mangement with J. E. Dunne, president, and F. W. Merrill, secretary-manager, has taken new and larger quarters in the Morgan building, Portland. It is branching out, putting on a larger force, and has a big program outlined.

⚜

The Oregon Dairymen's League now has 20 cheese factories. One of the most recently opened is the Lewis and Clark in Clatsop County. This is at the mouth of the Columbia River. Coos and Curry Counties further down the coast are improving and enlarging and are turning out a high grade of cheese.

Oregon. E. K. HILL.

Dairying Thirty Years Ago

The Iowa Homestead reports a scarcity of hay in that state. It states farmers have paid as high as ten dollars a ton for good tame hay. The spring is quite late in the Northwest. Scarcely any plowing has been done in Wisconsin at the date of this writing, April 10th.

⚜

The Union Brook cheese factory, Otsego County, New York, will apportion dividends the coming season on the relative value plan. It is encouraging to see so many cheese factories grappling with this question. Even if it does not work just right at first it is well to commence and find out where the obstacles lie in the road. It is evident that quality must be the basis of division in cheese making hereafter, and the sooner we understand what to do and how to do it, the better.

⚜

Now that the prices for meat are good, and prospect for the future better than it has been for some years, is the time for farmers to get themselves well grounded in the truth that well-saved skimmilk and whey have more feeding value than for some years back, and far more than farmers have usually given them credit for. This slaughtering of so-called "veals" that are "ten days less than two weeks old" is not only an outrage on the consumers—if there are such—but it is a financial blunder. With meat at present prices, every healthy, thrifty calf should be grown to from four weeks to three months old, and older, by feeding skimmilk or whey reinforced with oil meal and shorts, instead of using the valuable natural fat in the new milk. Do this while there is young stock plenty on the farm, and after such young things are gone, or grown up, feed the rations so compounded to the cows that give the milk—and make money by so doing.

⚜

It is just the right kind of a spring so far—as it rains every day or oftener—for us to expect, later on, a drouthy time, just when we need moisture most to give us good pasturage and a big hay crop. In view of such possibilities, and because it is a good thing to do any way, it will behoove the provident dairy farmer to make sure the growing of some soiling crops, so that he may not be stranded for cow feed, if he should be thrown upon the dry sands of an early or a late drouth. Blessed is the dairy farmer who has a few acres of winter rye as a kind of insurance policy against an early drought, and to tide him to the time he can have green oats or millet, and use them on to the time when early maturing corn will give him all he needs in the way of green cow-food.

The beauty of the whole thing in making such provisions to avert possible calamities, if the farmer don't really need them, they are all good crops to grow, to put in silo, or in dry store. So there is gain, whether the coming season is to be wet or dry. Have plenty—then you need not fret.

Milch Cow Statistics

The number of milch cows per 100 acres of crop and pasture land in England and Wales today is 7.8; Ireland, 10.2; Scotland, 8.2; Holland, 21.3; Belgium, 20.3; Denmark, 18.3; Switzerland, 15.4; Sweden, 14.9; Germany, 13.3; Austria, 11.1; France, 9.3; Italy, 7.1; Hungary, 4.8; U. S. A., 4.8; Canada, 3.0; New Zealand, 1.9; Argentine, 0.5.—Milk Industry, London.

FEED UP!

EVERY dairyman knows that he must feed proportionately for the light summer period, as well as in the heavy winter months, if he wants a large flow of milk from his herd when he can sell it at a good price.

Here is the way it works out:

Suppose your price for milk is $1.90—with an almost certain prospect of being lower when grass comes, and pastures are good.

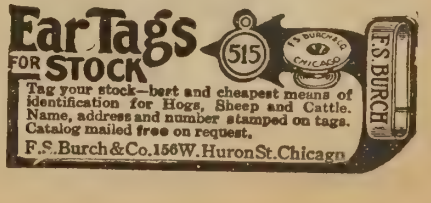
Now, if you feed Buffalo Corn Gluten Feed mixture at a cost of about $30.00, you can produce at least $130.00 worth of milk from your good milkers.

If your milk price goes down—say to $1.20—you can still get $84.00 from the same cows and the same amount of feed.

It has been proven that if you do not feed in the summer your cows will shrink after the first flush of grass. You will not only lose the profit you might have had from them by proper feeding, but, on account of their poorer condition, your herd will not produce as much milk, when you start heavy feeding again.

These are facts that should make every dairyman consider seriously his feeding problem, on a basis of cost and return, during the grass months now coming in. And then order Buffalo Corn Gluten Feed for your herd.

Corn Products Refining Co.
New York Chicago



FREE Write for full information giving the correct mixture for feeding Buffalo Corn Gluten Feed. If your dealer cannot supply you with Buffalo Corn Gluten Feed tell us who and where he is. Write today to Corn Products Refining Company, Feed Department, 17 Battery Place, New York.

Every dairy man needs this outfit. Points out the "boarder cow". Enables him to buy cows with his eyes open and to check up his creamery, etc. Tells him how to regulate feed to increase production. Highly recommended by U. S. Department of Agriculture, County Agents, etc.
Free with each testing machine: 4 test bottles, 1 acid measure, 1 pipette, 2 brushes, 1 bottle acid and Instruction Sheet giving complete information about testing milk and cream.

Holstein Sales Classic of '21

Wisconsin Bree

Milwaukee, State Fair Gro

Annual Convention State Association, All Day — May 16, Republican House

A 31-LB. DAUGTER OF "PIEBE" MAKING 850 LBS. OF BUTTER AND 21,000 LBS. OF MILK AS A JUNIOR 4. TO BE SOLD TUESDAY

We wish space allowed 130 photos. You would agree that in Wisconsin State Sales you can buy animals breeders won't price in their barns; it was ever thus. State Association pride accounts for this opportunity.

JOHANNA ORMSBY JULIET DE KOL
WISCONSIN'S STATE RECORD JUNIOR 3-YEAR-OLD (34.11 LBS. OF BUTTER, 578 LBS. OF MILK) NOW ON YEARLY TEST GOING 1000-LB. CLIP. HER SON IN THE MILWAUKEE SALE

FACTS!

Each animal from a State or Federal test and sold subject to 60-day retest.

Every animal guaranteed a breeder.

Papers accompany cattle to sale. You get them soon after settlement.

Wisconsin has a reputation to uphold.

All other State Sales have passed by. This is the last and best opportunity to buy at a Breeders' State Sale this spring. You know it is the truth.

Now is the time to buy. You won't regret.

To Be Sold:

Six beautiful daughters of Pietertje Ormsby Mercedes Della, (whose only 2 tested daughters to date made over 500 lbs. of milk and 22 and 24 lbs. of butter as Junior 2's), one of the very good sons of 37th and out of excellent daughters of Colantha Changeling Lad whose get have made up to 32 lbs. as three-year-olds.

Four splendid daughters of Iowana Sir Ollie out of high record dams.

A very nice yearling daughter of a 27.66-lb. cow who milked over 85 lbs. on two milkings a day. She is **bred to Pietertje Grahamholm Segis**—2nd prize winner at Hamlin and one of the good young bulls of Minnesota.

A 2-year-old granddaughter of Windsor Sweet Butter Maid (Wisconsin State record Cow) and out of a 25.83-lb. junior 4-year-old. **This heifer is in calf to Harvest Farms Matador Segis Bull.**

A wonderful young cow whose 2-year-old record is 20,266 of milk and 787 of butter due soon after sale time and in **calf to the 42-lb. bull King Bess Burke Ormsby.** Why not gamble on prospects for a herd sire?

A show ring winning son of Ollie. A real individual you will like him.

A splendid 2-year-old sired by a 30-lb. grandson of Pontiac Korndyke and out of a 31-lb. daughter of Terracelawn Hengerveld Segis. She **is in calf to King Bess Johanna Ormsby,** sire of the Junior Champion heifer at the recent National Dairy Show.

A 1,113.7-lb. butter daughter of Sir Johanna Piebe and Caroline Princess Pontiac. She has a two-year-old record also of 865 lbs. butter and 17,000 lbs. of milk. She is **in calf to Sir Ormsby Piebe Champion a real son** of Old Sir Piet out of a 610-lb. junior two-year-old. A real cow through and through.

A yearling son of the near 26-lb. 4-year-old daughter of Windsor Sweet Butter Maid—a real cow and one of the former Wisconsin Record Holsteins.

A show ring winning daughter of Sir Vickery Vale De Kol. She was third in that class of 81 at Milwaukee last fall. Also placed at the National.

A 5-year-old cow whose record at 3 years is 876 lbs. of butter and 18,292 lbs. of milk. Due right after sale and should make 30 lbs. Her sisters did with 611 lbs. milk.

A 26.45-lb. butter and 628-lb. milk record daughter of Oak Inland Jess and bred to Pinehurst's Sir Ormsby Beauty Pontiac Segis.

A very nice light heifer out of a 35.15-lb. cow and sired by King Agatha Pontiac Lass whose 4 nearest dams average 36.54 lbs. The dam has three records averaging 32 lbs. in 7 days.

A yearling son of Mary Segis Beets who just finished the year with 985 lbs. of butter and 22,904 lbs. of milk. He is sired by King Pontiac Artis Sadie Vale. We cannot say too much about this youngster. You will like him, too.

A dandy 4-year-old heifer who has just finished 7-day record of 23.8 lbs. of butter and 445 lbs. of milk. She is very good individually, is being continued on yearly work and is **bred to Sir Pietertje Mercedes 41st.** A good buy.

A very pleasing 25-lb. cow with plenty Colantha Breeding.

A high record 2-year-old daughter of Cedar Lawn Canary Paul—Grand Champion.

MARSHFI

A splendid 25-lb. daughter of King Johanna Korndyke Segis. She is a real show cow and will have a good start on yearly work and is bred to Pabst Piebe De Kol King. The Foundation kind.

A yearling daughter of Pabst Pontiac De Kol King from a 24-lb. dam. She is bred to a sire whose dam has over 800 lbs. as a three-year-old.

A 29.99-lb. 5-year-old cow that milked 690 lbs. of milk—nearly an average of 100 lbs. a day the entire test period. **Also her two-year-old son.**

A 25-lb. daughter of Sir Fobes Ormsby Pietertje. You know what the Fobes-Ormsby combination is doing in the Holstein World these days.

A fine individual yearling son of Sir Ormsby Banostine Champion—only son of **Duchess Skylark Ormsby,** the World's record butter cow. **His dam at 9 years of age made 700 lbs. in the ten-month division.** His two nearest dams average over 1,075 lbs. butter in the year.

A 24-lb. daughter of Canary Pearl of the Dairy. She is a large cow with well developed udder and a persistent producer having milked over 100 lbs. a day on official test.

ers' State Sales

ls — West Allis May 17th

130 Head

of choice individuals with highest records and popular breeding selected by special committee from 60 of Wisconsin's very best herds.

Remember the Holstein Breeders' Banquet, 7 P. M. May 16, Republican House

To Be Sold:

An excellent type high producing 30.29-lb. cow. She is a daughter of Sir Hengerveld De Kol Abbekerk and a sister to Milanhurst America De Kol, World's Champion 4-year-old.

A very handsome granddaughter of "Old Sir Pietertje." Her dam a 25-lb. three-year-old—the best of Dodge County breeding.

A very nice 24-lb. good producing daughter of a 30-lb. son of Pontiac Korndyke. This is one of the best things in the sale.

A 5-year-old proven son of 37th. He will weigh 2600 lbs. and is a splendid individual. Four of his daughters just finishing test are making over 600 lbs. butter with first calf. He is out of Daisy Queen De Kol who made 17,809 lbs. of milk and 871 lbs. of butter as Barney Kelly says "under the old system when it was hard to make 'em." Here is a real feature of the sale and a bull for someone who can use the proven blood of 37th. He comes from a small herd where new blood must be used.

A 2-year-old show heifer—the daughter of a 31-lb. cow and sired by a wonderful producing 30-lb. Albrecht bull and bred to a son of a 35-lb. cow.

A light colored straight toplined daughter of King Pontiac of Brothertown from a daughter of Colantha Changeling Lad.

A dandy granddaughter of King Pontiac of Brothertown bred to a fine grandson of May Echo Sylvia. This heifer was in the money in that fine Holstein show at Milwaukee last fall.

A choice 27-lb. five-year-old cow. Her dam has 830 lbs. of butter and 20,315 lbs. of milk in 337 days. She is due soon after sale to Pabst Pontiac Adonis, one of the best sons of King Pontiac Champion.

A splendid 2-year-old daughter of a wonderful old cow who has 3 consecutive times produced over 600 lbs. of milk in 7 days on three milkings a day. She made 18,295 lbs. milk in the 305-day division. This 2-year-old is **bred to a son of "Ollie" out of a 834-lb. 2-year-old who has just made** 29.40 lbs. as a three-year-old.

A very typy 5-year-old cow who has just made 25.47 lbs. and now on yearly test is going at a 1000-lb. clip.

A 33-lb. cow that will weigh a ton. She is the 4th over 30-lb. daughter of Sir Alban Pontiac Korndyke. **She is a sister to Hazel Pontiac,** last year's sale topper. Also to **Lady P Pontiac, a 31-lb. three-year-old.**

The yearling son of Wisconsin's new junior three-year-old State Record Cow. The dam of this calf just made 34.11 lbs. of butter and 578 lbs. of milk. She is being carried on yearly test and now going at 1000-lb. clip.

A real show cow that has milked 100 lbs. in a day.

A splendid individual young cow just completed 30.28 lbs. of butter and 565 lbs. of milk. She comes from a herd of all A. R. O. cows.

An outstanding yearling son of a young cow whose two-year-old record is 901 lbs. butter and 19,847 lbs. of milk. The dam of this young fellow has a sister also that made 31 lbs. in 7 days and 917 lbs. in the year as a 4-year-old.

ALICE PONTIAC PET 273129
A 33-LB. COW WEIGHING A TON. SHE HAS 4 ABOVE 30-LB. SISTERS. SHE IS TO BE SOLD TUESDAY AT MILWAUKEE

Bill Baird, Fred Southcott, Ad. Kaye, Rudolph Schaefer, Jerry Riordan, Frank Everson—all good Holstein Judges selected the 130 head. You may know the kind they would pick for our State Association Sales.

MILDRED SEGIS OF MOUNTAIN VIEW 276492
A 28.57-LB. DAUGHTER OF TERRACELAWN HENGERVELD SEGIS—SIRE OF THE SENSATIONAL GET OF SIRE AND DAIRY HERD AT THE LAST NATIONAL. TO BE SOLD.

LD, MAY 26

A daughter of Homestead Junior De Kol whose dam is a maternal sister to Miss Colantha Pietertje (27.35 lbs. at 4 years of age).
A 3-year-old proven 30-lb. bull of good type and a quick sure breeder from a cow that weighs 1,800 lbs.
The Sale Sensation—a wonderful 30-lb. granddaughter of "Old Sir Piet." They are hard to find and harder to pry loose and you know it.
A beautiful daughter of Pontiac Hengerveld Sir Korndyke claimed by some to be the greatest show cow in Northern Wisconsin.
A very sweet individual daughter of Juliana King of Rock (son of that famous old cow Queen Juliana Dirkje) now on test and making approximately 800 lbs. for the year.
Some splendid daughters and a son of Sir Bess Pietertje Fobes—a brother to Wisconsin Fobes Ormsby and carrying 75% same breeding of Bess Burke Ormsby the 42-lb. cow.
3 daughters of Roberts Pontiac De Fries. 3 daughters of Bluebird Canary Butter Boy. 1 daughter of Sir Ormsby Beauty Segis of Pinehurst fame.

FACTS!

The Wisconsin Breeders' Northern State Sale grew out of the desire to populate the vast dairy empire in the north of our state with a class of foundation animals which could only be secured by the State Association officials. Breeders do not care to and can ill afford to sell their best—yet they will part with one occasionally to keep up pride in the State Association and to boost good old Wisconsin Holsteins.

Harvest Farms Company

Consignment to the
Wisconsin State Sale
At Milwaukee, Wisconsin
May 17th, 1921

NO. 1—HARVEST LAKEVIEW LASS NO. 598049. In pursuance of our policy of supporting the State Sale, we are consigning the best animal in our herd. She is at the wrong age to bring what she is worth, but we believe that whoever buys her will long remember favorably the Wisconsin State Sale. The dam of this heifer is Lakeview Hamlin De Kol with a record of 140 lbs. of butter and 2700 lbs. milk in thirty days. The last two of the thirty days she milked over a hundred pounds. She has three A. R. O. daughters, two of which are in our herd. All three we believe will be 30-lb. cows. Lakeview Hamlin De Kol has three consecutive seven-day records averaging 31.60 lbs. Her last record was 35.20 lbs. We intended to run her on yearly work this year and expect another 30-lb. record and a good yearly record. She was chosen by Bob Lueger from our herd to be used in our little show string while she was running on test. The sire of Harvest Lakeview Lass is our Junior herd sire, King Agatha Pontiac Lass whose four nearest dams average 36.64 lbs Two of them are former world's champions. He is a good individual, having stood fourth at the State Fair two years ago and we expect to take him on the circuit of our little show this year. He has a nice list of A. R. O. daughters, although they are quite young and we have been twice second with his get as a young herd at the Wisconsin State Fair. A sister topped the last dairy show, going to Mr. Stewart at the Carnation Farms. This heifer is nearly white, a year old and was placed sixth by Mr. Moscript in the large and hard fought junior calf class at Milwaukee last year. We would like to keep her as foundation stuff because we can't buy better, but wherever she goes, she will do our herd much good.

NO. 2—MAYFLOWER HENGERVELD DE KOL NO. 289850, born 1915. Record at four years, 30.20 lbs. One of the nicest cows we have. We bought her last spring after she had been considered good enough to appear in the exclusive St. Paul National Sale. When we bought her she had a nice start on semi-official work, but she went off feed and we were unable to get her back on her stride. She was not tested this spring as we wanted her to be in nice shape for the sale. She is not a large cow but is an excellent producer and a good doer. Her sister, Milanhurst America De Kol, was world's champion as a junior four-year-old with 1200 lbs. butter in a year and 34 lbs. in seven days. This cow was bought with the purpose of putting her in this State Sale and we think will do us credit.

Harvest Farms Company
J. P. Riordan, Manager **Mayville, Wisconsin**

Quality Consignment
TO THE
Wisconsin State Sale
May 17, Milwaukee, Wisconsin

Sir Bess Ormsby Mercedes, a wonderfully good 5-year-old son of **S. P. O. M. 37th** from Daisy Queen De Kol. Her record of 871 lbs. butter from nearly 18,000 lbs. milk was made nearly 10 years ago.

Sir Bess Ormsby Mercedes now has 8 A. R. O. daughters, 2 that will have finished semi-official test at sale time.

He has been owned and is consigned by W. S. Comings, O. E. Gibson and Anton Hoesley of Eau Claire.

A 20-lb. 2-year-old daughter now making over 70 lbs. fat in her fifth month on "semi" will also be sold. You'll like her. She is bred to King Pietertje Ormsby Piebe 16th, the 32-lb., 1300-lb. son of K. P. O. P.

A 6-year-old cow just finishing a good 305-day record. She is bred to Sir Bess Ormsby Mercedes and if fresh at sale time, her calf will also be sold.

They are consigned by W. S. Comings.

A very good 4-year-old now on 7-day test and doing well is consigned by O. E. Gibson. She is a daughter of Milford Meadows Oak De Kol, a 34-lb. bull, and will be bred to "Sir Bess."

Look Them Up in Your Catalog and Look for Them at Milwaukee We are Sure They'll Please You

Dodge County Holsteins
TO
Wisconsin's Two State Sales
Milwaukee, May 17 — 23 OF OUR BEST FROM 9 DIFFERENT HERDS — Marshfield, May 26

At Milwaukee:

FROM SPRING BROOK FARM, BURNETT:

A choice unbred heifer, born Feb. 18, 1920. Sired by a son of Sir Pietertje Ormsby Mercedes. Her dam a 24.98-lb. 3-year-old granddaughter of Canary Paul Fobes Homestead.

FROM HARVEST FARMS, MAYVILLE:

Mayflower Hengerveld De Kol, a splendid 6-year-old cow. As a 2-year-old she made 18 lbs. butter in 7 days and as a 4-year-old 30.29 lbs. She is a beautiful individual in excellent condition.

Harvest Lakeview Lass, born March 4, 1920. Her dam, Lakeview Hamlin De Kol, has 3 records that average 31.60 lbs. Her last record was 35.2 lbs. in 7 days, 140 lbs. in 30 days.

S. M. RANDALL & SON, WAUPUN, CONSIGN:

Alice Pontiac Pet, a wonderfully good granddaughter of Pontiac Korndyke. She has just made 33.5 lbs. butter from 647.08 lbs. milk in 7 days. She is a splendid individual weighing 2000 lbs. in good condition.

Eleanor Fobes Mooie, a very good 2-year-old daughter of Joe Oak De Kol Fobes from a 28-lb. dam.

JOHN PULS, HARTFORD, CONSIGNS:

Colantha Cloverlawn 2d, a 25-lb. 4-year-old granddaughter of Sarcastic Lad. She is just fresh and doing very well on test. Will be continued on yearly test up to time of sale. Her dam is a 746-lb. 2-year-old and her 4 nearest dams average over 800 lbs. for a year.

O. H. ERDMAN, JUNEAU, CONSIGNS:

Bell Mutual Canary Homestead, a 27-lb. junior 4-year-old granddaughter of Canary Paul Fobes Homestead. Her dam is a 21-lb. junior 4-year-old sister to Oak De Kol Ollie Homestead. She is a splendid show heifer, now on semi-official test.

King Jess Evergreen De Kol, a son of Jess Evergreen De Kol 2d, 31.23 lbs. butter from 731 lbs. milk as a 4-year-old and twice over 31 lbs. His sire is a 33-lb. son of King of the Sadie Vales.

F. G. LEHMANN, WATERTOWN, SENDS:

Colantha Gladi Parana 2d, a splendid daughter of Colantha Gladi Parana (31.86 lbs. butter, over 600 lbs. milk) and by King Canary Oak De Kol, 34-lb. sire. She is in calf to a good 35-lb. bull. Look for her.

E. F. KUEHN, HORICON, CONSIGNS:

A 23-lb. 6-year-old cow, a top notch individual backed by the very best of breeding. Her record made as a 3-year-old does not indicate her ability. She will be one of the very best individuals in the sale.

At Marshfield:

FROM O. H. ERDMAN:

A 19-lb. 2-year-old daughter of a twice 27-lb. cow, one 27-lb. record made as a heifer, she from a 31-lb. cow that produced 721.5 lbs. milk. She is a granddaughter of Canary Paul Fobes Homestead.

A yearling son of Piebe Estata Blanche De Kol, 27-lb. cow with 612.8 lbs. milk. He is sired by a 33-lb. son of King of the Sadie Vales.

FROM HARVEST FARMS:

A splendid, big, 7-year-old cow whose 19-lb. record is no indication of her ability. She was bred October 4 to Spring Farm King Agatha Pontiac and should make an excellent record when she freshens.

Two excellent daughters of Spring Farm King Agatha Pontiac, whose 2 nearest dams average 37.10 lbs. His daughters now include a 32.54-lb. 3-year-old. One of these heifers is from a 24-lb. foundation cow, the other by a son of Paul Beets De Kol.

FROM SPRING BROOK FARM:

An excellent yearling heifer sired by a 30-lb. grandson of S. P. O. M. from a 16-lb. granddaughter of King Lyons. She is not bred.

A yearling son of Sir Pietertje Ormsby Korndyke from Princess Colantha Jewell 6th, 24-lb. daughter of a 25-lb. cow and dam of a 36-lb. daughter of S. P. O. M. 37th. He is a real bull.

They Are All Good Ones — They Come From a County Where Good Ones are Bred and Developed — Dodge County

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, April 25—The neutralizer butter ruling was again postponed on April 22, by the Acting Commissioner of Internal Revenue, M. F. West, by a new treasury order issued with the approval of Secretary of the Treasury Mellon to take effect June 1 unless otherwise ordered. Although the new Internal Revenue Commissioner has been named, D. H. Blair, of North Carolina, his confirmation has not taken place.

The new ruling, although very brief, contains the definite assurance that "further study is to be given to the whole case before the ruling date again is reached."

Secretary of Agriculture Wallace has interested himself in the case to the extent of making representations to Secretary of the Treasury Mellon calling his attention officially to the situation which existed when the latter took the portfolio, that is a strongly contested ruling which had been postponed to admit of a full hearing, and then the office of revenue commissioner vacated before the facts presented by both sides at the hearing had ever been analyzed or formally passed on. In view of this position taken by the secretary of agriculture it seems reasonably certain that the secretary of the treasury will take some action within the ensuing month to either cause the Internal Revenue Commissioner to review the facts, or to refer the entire neutralizer controversy back to the Attorney General for a review of the law in the case.

It is no secret that the opponents of the ruling wish the matter to go back to the new attorney general for a review of the law. The attorney general is understood to have taken informal notice of the pendency of this controversy, and to have characterized it as "another of the problems" left over by his predecessor.

The senate finance committee has been holding hearings on the emergency tariff bill, but careful inspection of the record as printed fails to reveal any effort or evidence of an effort to interfere with the schedules as contained in the original draft of the measure, including six cents tariff on butter, and the other dairy items just as passed by the last Congress. The work of the committee has been directed toward the two sections added in the present congress relative to the so-called American valorization and the anti-dumping clauses, and both of these are to be modified in a number of details by committee amendments. It will take carefui scrutiny to determine what effect, if any, these amendments will have on the general effectiveness of the bill.

The Ways and Means Committee continues in daily "executive" session, considering the general tariff measure. There is a story that a strong effort has been made to add fertilizer materials to the free list, but that the agricultural sub-committee has been denied control over these items, which have been taken over by the sub-committee on manufactures, of which Congressman Longworth is chairman, and that this sub-committee intends to put a duty of twenty per cent on these items. This, if done, will increase mixed fertilizer costs two or three dollars per ton to the final purchaser.

Representative King of Illinois has introduced a butter standardization bill but the committee on agriculture to which it was already referred has already scheduled its time until the second week in May with grain futures and packer control legislation. It is quite certain that this bill will not be urged, should the neutralizer controversy be settled by the attorney general or the treasury department.

W. P. Warber, who for more than a year past has been manager and Washington representative of the National Milk Producers' Federation, closes his work with this organization at the end of April, and will engage in college work for the ensuing year. C. W. Holman, heretofore connected with the building and finance committee of the National Board of Farm Organizations, with which the Milk Producers' Federation is affiliated, will assume the work carried on by Mr. Warber. Mr. Warber was formerly in the Bureau of Markets, as a dairy marketing expert, and has a long record of splendid service for the dairy industry, which he is sure to continue in whatever work he takes up.

D. G. Harry, president of the Maryland State Dairymen's Association which supplies the fluid milk sold in Baltimore, has been spending some days on business in Washington. His association, along with a number of other milk producer organizations, is about ready to enter into the con struction and operation of its own surplus milk plant. Unlike some of the others it is planning to increase its cash surplus sufficiently to have the money in hand to go into this branch of the business, before making special plans for the plant, and with this end in view it has already put up to its membership, and secured approval for an increase in its brokerage charges sufficient to accumulate several thousand dollars per month in a reserve fund. The situation, according to President Harry, is sufficiently well in hand in the Baltimore area so they are able to care for this summer's expected surplus without needing this plant, unless some emergency arises, and by another season they will be ready to finance anything they may need.

President Harry speaks very enthusiastically over two other features of their organization work; one, their relationship with the distributors, and the other, their effort to put milk into every public school in Baltimore. This latter project is now completely successful. With the co-operation of the school board and the assistance of the distributors and several local agencies such as the Parent-Teacher Associations and the Board of Health, they have milk in pint bottles delivered to every public school, so every pupil who wants it can purchase it at cost, four cents a bottle. This, with a provision so that ten per cent of the entire supply is delivered free of cost to be given to deserving pupils who can not pay for it, rounds out their plan.

Health Officer W. C. Fowler of the District of Columbia, with the approval of District Commissioner James F. Oyster, himself one of the big dairymen and distributors of the city of Washington, has prepared and submitted to be introduced in Congress a new milk law for the District of Columbia. In this it is proposed to grade all milk which comes into Washington as Grade A and Grade B, the latter to be labeled "for cooking and manufacturing purposes only". There is no let down of the tuberculin test now strictly enforced in Washington milk supply, but Grade A milk is to be based on a triple scoring proposition, the farm to rate above 70, the dairy to rate above 85, and the cows above 90 on the score cards used for this purpose by the District of Columbia Board of Health. The milk must also be cooled immediately to 45 degrees or lower and kept at that temperature until delivered if sold "raw" or pasteurized, and then recooled if sold as Grade A Pasteurized. No

ABSOLUTE DISPERSAL SALE

Forty-four Registered Guernseys

GEO. W. BROWNE, Owner, Waukesha, Wis.

(LIVE STOCK PAVILION)

THURSDAY, MAY 19th, 1921

A very uniform lot of splendid individuals will be offered in the sale, all backed by the very best breeding. Fourteen A. R. cows and cows now on official test are offered.

Practically all females are bred to Rex of Broad Ripple No. 61960, whose dam is Marietta of Maple Hill A. R. 4946, milk 15,071.1 lbs., butterfat 797.7 lbs. Animals will all be sold without reserve. Positively no by-bidding permitted. Females are guaranteed breeders.

Such splendid individuals as the following are offered:

REX OF BROAD RIPPLE NO. 61960, whose dam has record of 797.70 lbs. butterfat.

MAY KING'S DOLLY OF INGLESIDE A. R. milk 13955.0 lbs., butterfat 644.86 lbs., Class A.

CRITERION'S MILKMAID NO. 83347, A. R., butterfat 535 lbs. at 2 years.

SUNNYBROOK MIGNONETTE 64437, winner of many prizes. Sired by Florham Autocrat A. R.

CREAMLAND BLANCH NO. 82472 (A. R.) milk 7380.9 lbs., butterfat 466.3 lbs. at 2 years.

FRAU OF MERIDIAN 2D NO. 38978 (A. R.) milk 10,669.7 lbs., butterfat 571.62 lbs.

BESSIE'S YEKSA STARLIGHT (A. R.) milk 8285.8 lbs., butterfat 454.04 lbs. at 4 years.

DUCHESS OF MAPLE HILL A. R. 5769, milk 10,621.1 lbs., butterfat 535.92 lbs. at 1 year, 10 months.

LILY ROSE OF MAPLE HILL, on test, in 31 days has made 1174.1 lbs. milk, 48.96 lbs. butterfat at 3 years.

LAKE SHORE COUNTESS, on test, in 59 days has made 1738.9 lbs. milk, 72.7 lbs. butterfat at 4 years.

MAY BIRD OF EDGEMOOR, on test, in 115 days has made 3510.9 lbs. milk, 144.9 lbs. butterfat.

DAIRYMAID'S GIFT OF FOX VALLEY, on test, in 105 days has made 3053.3 lbs. milk, 139.71 lbs. butterfat at 2 years.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Some Things a Junior Should Know About Pigs

We know that many of Hoard's Dairyman juniors are interested in raising pigs because they have said so in their letters to us. This is a very splendid piece of work to engage in and, for those who are doing it, the attempt should justify itself in a product that shows the experience was worth while. Too many pigs are just allowed to grow up without much attention paid as to how long it takes for them to do so or what they will be like when they have. This, you will all agree, is not the kind of pig raising that we want our juniors to engage in. Unless you know more about the job of raising pigs when your pig is grown up than you did when you started out, you surely cannot be considered a success. It is a real job to raise a pig and the fellow who is not willing to do his best should never attempt it.

He Should Know About the Leading Breeds

Every junior hog man should know that no one breed is best. Any of the standard breeds are good and will respond to your efforts if you treat them the way you should. There are the Poland-Chinas, the Berkshires, the Durocs, the Hampshires, and the Chester Whites. All are good breeds and it would be difficult and also unfair to attempt to say which one is the best for you. If your community is largely interested in a certain breed, then undoubtedly it is good policy for you to select one of that breed. But there is another element to be considered in making a choice and that is the matter of personal preference. The breed that appeals to you the most is the one to select providing it is one of the leading popular breeds. If you have talked with hog men, you have found out that the breed that each is raising is the one he likes the best and he has tried to tell you of all the good things about his breed. This is a perfectly natural trait, but it does not follow that you should raise a pig of the breed that he thinks is the best. One must satisfy his own fancy when he makes the final choice.

He Should Know the Kind of Individual to Select

Of course you will also agree that the pig you are raising is of greater interest to you than the breed he represents. No matter what the breed, a junior pig man should know the best type to raise. There are some fundamental things to be considered about the individual regardless of the breed. He should be good looking first of all and, in order to possess this quality, he should be a pure-bred. If he is, he is much more likely to please the eye of the judge with good looks. We don't believe it is good policy for a junior to be spending his time on scrub pigs. The job is too important and life is too short to spend time on scrubs. There's no fun it either and when it comes to marketing your pig, the scrub doesn't stand very much chance of bringing the top-notch price.

He should be vigorous and compact in body, should stand squarely on all four feet, should have strong pasterns and his back should be well arched and the belly line should be straight. With all these qualities, he will have a symmetrical body. But this isn't all that should be looked for. His face should show signs of intelligence. There should be good breadth between the eyes and the skin of the face should be smooth, rather than wrinkled. The throat should be neat and free from excess flabbiness. The neck should be short and smooth and should blend smoothly and neatly into the shoulders. The width of his body should carry out uniformly from head to rump. The back should be wide and uniform and the ribs should be springy. The body, shoulders, and hams should all show good depth and the flesh should be firm and free from wrinkles. The tail should set at good height and the rump should be wide and level with sufficient length to carry out the body well. With all these characteristics, there should be present fine clean bones and a silky coat of hair, both of which a judge pays much attention to in determining quality.

And it is also very important that your pig should conform to the breed type. If he is a Poland-China, then he should present the type features for this breed in a very pronounced manner. For those juniors who have already selected their pigs it might be interesting for them to make a study along these lines.

He Should Know About Weaning Pigs

Some juniors that we know of are raising a whole litter of pigs. This means more work for them as they are starting with the pigs from the very beginning and they have more of them. One of the important things to look out for is not to allow them to suffer too much of a set-back when they are taken from the mother. This can be accomplished with a little forethought. Pigs should be weaned from six to ten weeks old. Nine weeks would represent a good average length of time for them to run with the sow, providing she is giving plenty of milk. But weaning time must come and it is safe to say that it is the most critical period that a pig must go through. Many fine litters are ruined at this time through improper feeds and feeding methods or through mere shiftlessness. If the weaning is properly done, the pigs soon become contented without the mother and no serious consequences follow. But, and this is where the rub comes in, do you know how to proceed? From this time on, you will have to proceed intelligently if you are to expect good results. Quite contrary to what some seem to think, weaning does not consist of shutting the pigs away from the mother so that they are deprived of the accustomed feed, to be forced to live on a substitute of corn and other grains. If you proceed in this manner, failure will be inevitable and you might just as well throw up the job before you get thoroughly disgusted.

YOUR PIG WILL DO BETTER IF HE HAS THE FREEDOM OF A PASTURE
(What breed is this young gilt?)

There is a right way and we want you all to know it. Pigs should be taught to eat at least three weeks before they are weaned. It is an easy matter to make a creep for them which they will soon learn to use. The creep should not admit the sow, but should be close to the place where she is being fed daily. If the feeding is done in a pen so much the better. The creep should have a clean trough and it is very important to keep it clean. A slop made of skimmed milk in which has been stirred some wheat shorts or middlings makes an ideal ration and they soon learn to look for it at feeding time. It not only teaches them to eat, but it supplements the mother's milk in addition and keeps them growing and contented. Feed only as much as will be nicely cleaned up at each meal. A little corn scattered in the bedding will aid in giving them exercise if they are confined. If this has been done, weaning will be an easy matter for you and for the pigs. They have learned to eat and they will soon be satisfied without the mother.

Skimmilk and middlings make about the best feed for young pigs after they are weaned. It is better not to be in too much of a hurry to feed grain of any kind, and it should be introduced very sparingly at first. At no time should they be fed exclusively upon grains for such feeds are not muscle formers and the pigs will soon cease to grow. At the age of two months a good pig that has been properly cared for should weigh about 30 lbs. to 40 lbs. and it will not be long after that before he weighs 50 lbs. At this time he should be fed something like this: A grain mixture made of 32 lbs. of corn meal, 32 lbs. of middlings, 32 lbs. of ground oats, and 4 lbs. of oil meal will be found very good. A pound of this mixture for a daily grain ration will be sufficient for each pig in the litter. Now, if skimmilk is available, the grain mixture can be mixed with about five pounds of it per pig for a daily feed. This will form an ideal ration for the first three or four weeks and after that the amount of the grain ration may be increased. Usually for the first eight weeks after weaning, it is best not to feed corn in greater amounts than to form more than one-third of the grain ration. There is nothing that will take the place of skimmilk, and those who have it are very fortunate indeed.

Another good growing ration is ground barley, 4 lbs.; shorts, 4 lbs.; gluten feed, 2 lbs., and skimmilk, 3 to 4 lbs. The fundamental principal at this time of the pig's life is to feed a ration that will build muscle and bone so that he will receive his proper growth preparatory to the fattening period. It is a good plan to feed them at least four times a day at first and to feed in small amounts. Gradually this can be changed to three feeds daily as they grow older and have made a good start. If skimmilk is not available, then we must substitute something that will be bone and muscle building. Tankage is a good thing and then we might have a ration something like this: corn, 5 to 6 lbs.; shorts, 3 lbs.; and tankage, 1 lb.

He Should Know That Hogs Like to Graze

The hog is quite naturally an animal that feeds upon concentrates like the grains. But we must not forget that hogs like to graze in pastures. It is a well established fact that a hog will make greater gains from a grain ration when it is supplemented with good pasture. In addition to the more economical gains made, pasturing furnishes exercise for pigs. This is absolutely necessary if one expects the best development in his pigs. Exercise encourages growth and tends to build an animal of strong vitality, which is the type we all want to grow.

But we should not make the serious mistake that some have made in the past, thinking that just because their pigs were feeding upon good pasture there was little need for grain of any kind. This is a great mistake and we do not want you to make it. As we have already said, the pig is better adapted to feeding on concentrates than he is upon roughages. It is the combination of the two that offers the best results, and since he has grazing tendencies, we should take advantage of them in producing pork as cheaply as possible. So don't take away the grain ration when pasturing your pigs. But you may cut down. Some hog men say that when hogs are grazing on good productive pasture, it is a good plan to feed about two pounds daily of a well balanced grain ration to each hog for every 100 lbs. of live weight that he can show. This should be fed regularly twice a day and at all times there should be free access to good fresh water.

He Should Know What Forages are Good for Pastures and How to Produce Them

We may speak of two kinds of pastures upon which hogs may be grazed, permanent and temporary. Naturally the first kind must be made of fairly long lived plants, such as alfalfa and blue grass. If convenient, either of these pastures furnish excellent pasturage for hogs and they also have another decided advantage. One may pasture on these, starting very early in the spring simply because these crops make an exceedingly early growth. You are very fortunate if you have hog pastures made of alfalfa, blue grass, or any of the clovers. They are usually there each year and thus they do not have to be so frequently reseeded, excepting in the case of the clovers which usually are looked after at least every second year.

But it is not always possible for one to have permanent pasture and, furthermore, that which he does have may have to be supplemented with something else in order to furnish a good supply during the summer

months. For this purpose, we must resort to the shorter lived crops such as rape, peas, oats. soy beans, and the like. These are all annual crops and must be seeded each year. Hence, pastures made from them are only temporary, that is, they are good for the same season in which they were planted.

Perhaps foremost among these stands rape, a plant that looks very much like the turnip. In fact, it belongs to the same family of plants. Hogs are very fond of this pasture when once they become accustomed to it. It grows rapidly and furnishes very large amounts of feed. In addition, it is very nourishing and hogs will make good gains on it. If seeded alone, the best way to proceed is to seed in rows about 18 inches to 24 inches apart. It makes a better growth this way and there will not be so much waste when the hogs are pasturing, because they will follow the rows while feeding. It may be seeded in May and June and about six to eight weeks after that it may be pastured. If it has been seeded on a good, fertile, clean soil, it will furnish pasture for the remainder of the summer and during the fall months as well. Owing to the fact that there is more than one kind of rape seed on the market, one should always be careful when buying the seed to call for the Dwarf Essex rape.

Because there is some time after planting before one can pasture rape, he might use a combination of oats, peas, and rape. The oats and peas will furnish pasture earlier in the season and by the time they become too old to be readily eaten by the hogs, the rape will be ready. If this combination is used, a bushel and a half of peas and oats each together with about four pounds of rape will be sufficient for one acre. The peas and oats can be seeded together while the rape can be seeded alone, following the other two. This combination has the advantage of providing pasture throughout the entire season and the hogs like it. When rape is seeded alone four to five pounds of seed per acre should be sufficient. We think that it would not be out of place at all for you juniors who are raising pigs this summer to also raise at least a patch of rape, and you will find that if you are keeping your pig shut up, he will greatly relish the rape that you can cut from your patch. Try a small amount any way, and the next year you will be so enthusiastic about its value for hogs that you will want more of it. And by all means if you have to raise your pig shut up in a pen or in a yard, see to it that he gets plenty of green feed along with the grain you are feeding. Remember the test of you as a junior hog man will be largely determined by how well your pig progresses and what he finally turns out to be, and the right kind of feeding is the one big problem for you to look after.

He Should Know About Some of the Common Ailments of Hogs and How to Treat Them

One should always be on the watchout for diseases and troubles of all kinds that stock is subject to. We should keep an open eye to all of them. Although a hog is usually a rugged animal, it does not follow that he is without his ailments.

Do you know, juniors, that hogs can have lice? Many of us have never suspected that, but nevertheless they are frequently infested with them. Lice may attack them at any age and, when the infestation is severe, they suffer a great deal. The lice feed from the blood of the animal and in order to do this, they puncture the skin which causes an itching. When the case becomes very bad, the constant irritation made by the lice feeding causes the hog to rub himself against anything that he can find. This rubs off the hair in patches and often breaks the skin open into sores. This is very bad indeed and you couldn't expect a pig to grow very fast if infested to this extent, so we should all be on the lookout for these pests.

When they are once discovered treatment should begin at once. Crude petroleum is a very effective remedy and may be applied by hand. One-half pint of kerosene mixed with one pound of lard is also advised as an excellent and efficient remedy. Either of these treatments is also good for the prevention of hog mange, another serious trouble that hogs are sometimes liable to have.

He Should Provide Some Kind of Shelter

If you are raising your pig confined to a pen, it is of extreme importance that it be kept clean. He should not be forced to live in filth and dark. They like the sunlight and, for this reason, it is best to have a yard of some kind in which he may move about. In case you are keeping him in the pasture, all that will be necessary is to provide some kind of shelter there for him. If you don't happen to have a portable hog house to move out to the pasture, a dry goods box large enough so that he can comfortably enter, will provide a satisfactory shelter.

Raising a pig is just like any other enterprise. It takes a close study to do a good job. And the junior who studies his pig from every angle while he is raising him is the fellow who will finally win out.

Junior Letters

Hoard's Dairyman Juniors:—We are milking three cows and will have a fresh cow in about two weeks. We have four heifers and one registered bull and four horses and two colts. We have four brood sows and fourteen pigs. I have a sow and belong to the pig club.

Mamma has about 250 chickens. She has one hen setting. She gets about five dozen eggs a day. We have eight little rabbits and two old ones. I have a little dog of which I think very much. His name is Zip.

Oh yes, I forgot to mention my cow and calf. They are both getting along fine.

Indiana. Wayne Austin.

Hoard's Dairyman Juniors:—I have been reading the junior letters and stories for some time and I like them very much. I got my creed, button, and fob, and like them too.

I like to go to school. I have about a mile to walk morning and night. I live on a farm of 70 acres. We also rent ground.

Dad keeps Guernsey cows. We have 5 registered and 4 grade cows and 5 Guernsey calves. One is mine. We also keep Poland-China hogs. I have half interest in a sow and 5 pigs. Brother and I have a horse that sure is fine to ride.

I have a girl friend who lives half a mile away from where I live. She has a riding horse, too, and we have lots of fun riding horseback in the summer.

We are not going to have any help this summer so dad, brother, and I will have to work hard. We have some of our plowing done and will be ready to plant oats if it gets dry.

My letter is getting long so will close wishing the juniors good luck. Wish some of the juniors would write to me. I will answer any of the letters I get. My address is R. 3, Marysville, Ohio. Mildred Snyder.

Hoard's Dairyman Juniors:—I am 12 years old now and in the 6th grade at school

I have a few hens and a Collie dog which is named Rover. My father has about 30 cows. Our barn floor is of cement and we have a milking machine and three silos. We have a horse barn and two working horses. We have 4 automobiles and I have a bicycle that I ride to school.

The name of the farm that I live on is Lone Pine Farm. My father has a milk route in Mystic, seven miles from our house. He delivers the milk in a ton truck.

If any of the juniors wish to write to me my address is R. 1, Mystic, Conn.

Frederic B. Allyn.

Hoard's Dairyman Juniors:—We live in a small place 80 miles away from our farm. We left the farm for a while so I could get my schooling. I am sorry to be away from the farm because I like farm life best.

I am going to have some rabbits soon.

I get quite a few horses to ride and am glad I can for I don't know what I would do if I did not have a horse to ride.

Well, spring is coming and I am glad. I am near a lake so in the summer I can go swimming.

British Columbia. Eleanor Bower.

Hoard's Dairyman Juniors:—We had a mild winter here. Some days in March were as warm as a day in summer.

We are milking seven cows now. My brother and I have a Durham cow and a heifer calf. We bought the cow when it was three days old. The calf is a daughter of this cow.

We expect to keep some ensilage till next fall as we have about nine feet left. My father sold a load of hay about a week ago for $17. There will be a large amount of hay left if the warm weather continues.

Our chickens have been laying almost all winter. They are laying from eighty to ninety eggs per day now. I expect to get a small flock of Barred Rocks this summer.

We had nine little pigs but the mother killed five so there are but four left.

I will close now, wishing all the juniors good luck.

Michigan. Harold Boer.

Hoard's Dairyman Juniors:—I have been reading the junior letters every week and am becoming more interested.

We are having fine weather here.

I go to school every day. Our school starts at nine o'clock and closes at four. When I get home at night I eat supper and then do chores. One of our calves weighed 325 lbs. the other day and is only three months old. We have two more close to seven months that weigh 400 lbs. They are all registered bulls.

I wish the juniors good luck. If any of them want to write to me my address is Rocky Ridge, Ohio. Hazel Biehler.

Hoard's Dairyman Juniors:—The first thing I will tell you about is the fair that I attended last year and at which I had some exhibits. I had my heifer calf there and won first prize on her which amounted to five dollars. I also had some oxhart carrots and won second prize. The festival we had in our own community this winter turned out to be a success. I had some triump potatoes there and won first prize. I also took some of our silage and got second prize and second on barley. On our program was a debate which the people were very much interested in. Well, it is nearly seeding me; we are now doing some plowing which we could not do last fall because my father broke his arm the sixth of November and by the time he could use his arm the ground was frozen.

Wisconsin. Geo. Stodola, Jr.

Hoard's Dairyman Juniors:—I will let you know that I did not go out of the club. I have a pure-bred Holstein calf. She was a year old the 4th of April. She is almost as tall as I am. I am going to take her down to the county fair. I feed her silage, clover hay, and mixed feed. I have four rabbits; one of them is a Belgian hare. The others are brown and white. We have seven Chester White pigs and one dog and twelve cats. The dog's name is Rover. We have 67 head of cattle; 19 of them are pure-breds. I go to a public school. I am 11 years old and in the sixth grade. I always read the juniors' letters and enjoy reading them. Wishing the juniors good luck.

Wisconsin. Aloysius Kornely.

Hoard's Dairyman Juniors:—My father has taken Hoard's Dairyman for a long time, and I am interested in the junior letters. I am ten years old and in the fourth grade at school. We had an examination two weeks ago and my average was 96%. We live on a 160-acre farm. We have 27 Holstein cattle; 6 are yearling heifers. We have a Collie dog and his name is Rex. We have electric lights and a two-horse power motor. I milk three cows every night and morning. I live one mile from town and I go to school every day. I hope some of the juniors will write to me. My address is R. F. D. 5, Bloomer, Wis.

Eldon Krenz.

Details page 18 Illustrated Catalog 1100 Bargains. Free. STROUT FARM AGENCY, 150 DL Nassau St., New York City.

We have three quarter-sections of land in Bottineau County, North Dakota and two quarters in Renville County, North Dakota. We are in the market to exchange a quarter or more of this land for some registered Holstein cows or heifers. We would want them to be of good quality, and we would price the land right. We have a 1,200-acre stock farm close to our place of business here in Illinois and could use these cattle to better advantage than we can the land in North Dakota. If you have anything to offer, kindly let us hear from you stating the age of your cattle, the number, the price, and whether or not they are tuberculin tested. BANTA BROS. & CO., Lowpoint, Illinois. 16-3

66 tillable acres, 10 acres developed muckland, 450 pear trees. House, fifteen rooms, steam heat, bath, electricity, telephone. Barn 40x60, wing 26x36, water and concrete floor in basement. Several other buildings, splendid condition. One-fourth mile city limits. Six cows, team, tools. $15,000, $5,000 down. BOX 36, Oswego, New York.

Register and secure a Farm—Our colonization plan offers the man who wants a farm a greater opportunity than a U. S. Homestead. Good man can register and get good land, and we furnish him 4-room house, barn, cows, and tools. To show good faith settler deposits $500 on buildings and stock—that's all. After 3 years, settler pays for farm at $100 a year. Over 100 registered, got farms and started last year. Many from Wisconsin. Good places on new road ready right now, so write for free books, maps and registration blank, or come at once to look. NATIONAL LAND COLONIZING CO., Box A15, Ladysmith, Wisconsin. 16-3

Look! For sale, 120 acres, fair buildings. Price $1,200, only $400 cash. JOHN FRANTZ, Earlville, New York.

FARMS WANTED

Wanted to hear from owner of a farm or good land for sale for fall delivery. L. JONES, Box 125, Olney, Illinois.

EXCHANGE

Wanted To Exchange—160 acres virgin prairie land near Winnipeg for cows, heifers and farm stock. Write for particulars. F. H. BEILHARZ, Janesville, Wisconsin. 16-4

For trade a good 160 acres, all fenced, for registered Holstein cows and heifers. EMIL WOLLENBURG, Donnelly, Minn. 16-2

Advertising in this department is 7c per word. Remit in advance.

HELP WANTED

Wanted—A middle-aged, single man for test barn to milk 5 or 6 Holstein cows on semi-official test and to take care of calves. Must be steady and competent. State experience, wages and reference. JOHN BAZLEY STOCK FARM, Route 5, Ypsilanti, Mich. Phone 705F4. 14-3

Wanted—Married man to work 90-acre farm stocked with pure-bred Holsteins. Good cow man, a little knowledge of A. R. O. work preferred. Also knowledge of general farming. Shares or salary. ARCHIE REID, JR., Janesville, Wis. 14-*

Pedigree Writer Wanted—Wanted, young man or women with a fair knowledge of Holstein-Friesians to learn pedigree writing. State age, past experience, typist experience and wage expected in first letter. WESTERN HOLSTEIN PEDIGREE CO., Webster City, Iowa. 15-2

HELP WANTED

Wanted—Herdsman. Married man with small family for Guernsey herd. Must be well experienced handling cows on official test, good calf raiser, capable of producing results, willing to stay long and have unquestionable references. Modern barns and good stock. Modern cottage. State particulars, wages expected and how soon can come. Position open at once, as our herdsman died suddenly. Can use also a steady single man who has some experience with cattle as assistant herdsman. BEECHWOOD FARMS, Sharpsburg, Pennsylvania. 15-2

Wanted—Railway mail clerks. $135 month. Write for list positions. FRANKLIN INSTITUTE, Dept. L115, Rochester, New York. 16-4

Wanted—A good single man on pure-bred Holstein farm. Must be good dry hand milker, and willing worker. State experience and wages in first letter. ARTHUR BLUM, R-1, Watertown, Wis.

Wanted—Test cow milker, single. Must be first class milker. No other need apply. JOHN ERICKSON & SONS, Waupaca, Wis.

Wanted—Man with money to establish cheese factory. 600 good dairy cows within a radius of four miles. Write MIAMI COMMERCIAL CLUB, Miami, New Mexico. 16-2

Capable and experienced herdsman, to take charge of 300 pure-bred and high-grade Holsteins. Must be qualified in practical feeding, sanitation, production of certified milk, calf raising, veterinary work covering all minor ailments, capable of handling men with economical efficiency. Furnish references, experience, salary expected, and date available for duty. Six-room house, bath, heat and light, and other allowances furnished. Address COMMANDER T. DeF. HARRIS, In Charge Naval Academy Dairy, Gambrills, Md. 16-2

Wanted—Experienced dairyman under forty years of age and single to take charge of a herd of seventy-five registered Holsteins. Must be competent to do A. R. work and furnish best of references. Give full particulars including wages wanted, in first letter. R. R. BAIN, care Bainridge Farm, Lisle, Ill.

Wanted—A housekeeper on a dairy farm, age between thirty and thirty-five. Give reference in first letter. Address BOX 741 care Hoard's Dairyman.

Wanted—June 1st, an experienced dairyman, married, could use father and son. Both seven-day and yearly test work. Salary and bonus on records made. Registered Holsteins, good cows. Modern barn, pleasant surroundings. E. DICKINSON, Bellefont Farms, Bellefontaine, Ohio. 16-2

Wanted—Married man for general farm work, wife to assist with housework. PAUL GAVIN, Walworth, Wisconsin.

Wanted at once—Good, reliable, single man or boy who can and is willing to do anything about farm. $30.00 per month and board. CRYSTAL SPRING STOCK FARM, Littlestown, Pa. 16-3

Wanted—Good all round single man on dairy farm. State wages. WILLIAM DAVIDSON, Kipton, Ohio.

Wanted—Single herdsman, A. R. O. experience preferred, to have entire charge of 35 head of milch cows. State age, wages and references. FUHREMANN CANNING COMPANY, De Forest, Wis.

Help Wanted—Working farm manager for 300-acre farm fifty miles from Chicago. Farm to be run on business basis. Manager must be familiar with machinery, tractors, and all things pertaining to successful farm, and able to farm economically. Must have good references. Address BOX 743, care Hoard's Dairyman. 16-3

POSITIONS WANTED

Cook—Former employer wishes to secure position for middle aged widow woman as cook for large farm. Fully capable of taking charge of boarding house and running it in an economical, orderly manner. Can furnish best of references besides our own unqualified recommendation. Address BOX 735, care Hoard's Dairyman.

Farm Manager—Scientific, practical, energetic, is now available for position. Lifetime experience in constructive dairy-farming, A. R. O. records, feeding and breeding of pure-bred livestock, production of certified milk, etc. College graduate and at present teaching Dairy Husbandry and engaged in Dairy Research work in State College of Agriculture but desire to get back on the farm. Only large proposition where results are appreciated will be considered. Address BOX 738, care Hoard's Dairyman. 16-2

Position wanted as working farm manager. Have two boys 14 and 15. Address BOX 737, care Hoard's Dairyman.

Position wanted by American cheesemaker, long experience, married. Prefer good factory that runs the year round. Address BOX 736, care Hoard's Dairyman. 16-2

Wanted—Job on modern dairy by young man, age 21. Experienced and good worker. Holsteins preferred. HARLEY SHAW, 6 E. High St., Marshalltown, Iowa.

Wanted—Positions together, by two single young men, on modern dairy. Either party can milk a string of cows by hand or run milking machines. Experienced buttermakers and creamery men. Can furnish best of references. Kindly state wages. Any locality. D. R. CLARK, 71½ E. 28th St., Portland, Oregon.

Young man of good education now connected with one of the leading Holstein herds, wishes charge of small herd where yearly work is carried on. Years of of experience in rations, herd records, etc. Recommendations the best. State salary in first letter. Address BOX 739, care Hoard's Dairyman.

Lady, age 35, with school child, desires a position. Farm boarding house and private house experience. Please state full particulars, wages, etc. MRS. M. WEIFENBACH, 3239 North Oakley Ave., Chicago, Ill.

College student desires position in large modern dairy for summer. Address BOX 740, care Hoard's Dairyman.

Young single man wants position with Holstein or Guernsey herd, doing A. R. work. College graduate, best of reference. State terms in first letter. HECTOR L. HANSON, Rice Lake, Wis.

Farm Manager—Scientific and practical, executive ability, loyal, economical, reliable. References. Address BOX 742, care Hoard's Dairyman.

MOORE'S SPRAFLY

Protects cattle and horses from flies. Allows them to feed in peace. Is easily applied with a sprayer. Saves double its cost in extra milk. An oily liquid, it spreads quickly, sticks fast, and goes far. Absolutely harmless, and satisfaction guaranteed.

Washington, D. C., Weekly News

(Continued from page 679)

mention is made in the proposed law of a bacteriological count as part of the test to determine the classification of milk between the two grades.

There are two reasons for pressing this measure at this time; the attack in the courts on the sufficiency of the Board of Health rules requiring tuberculin tested cattle as the source of all milk permitted to be sold here, and the difficulty of enforcing cooling standards.

Dr. C. W. Larson, Chief of the Dairy Division, has been spending the past week in Oklahoma. Appropriations have been made for the necessary equipment and men to carry out co-operative work in dairy extension and research in that state, and his trip there had to do with final approval of building and other plans.

Helmer Rabild has definitely accepted the offer of the Michigan Milk Producers' organization to take charge of their proposed surplus milk plant. He will leave the Department of Agriculture, where he is now in charge of dairy extension work in the Dairy Division, within a few weeks to take his new position. He will be located in or near Detroit. Mr. Rabild was in Michigan for a time before joining the Department of Agriculture staff thirteen years ago.

Ohio's Guernsey Field Man

James E. Harper of Otsego County, New York, has been employed as field man by the Ohio Guernsey Breeders'

JAMES HARPER

Association. He will devote his entire efforts to breed promotion work in the state, with headquarters temporarily at Chagrin Falls.

Ohio's field man was born and reared on a farm in Connecticut. He graduated from the Massachusetts Agricultural College in 1915. In the year 1915-16 he took a graduate course at the Iowa State College and received his Master's Degree.

During the following year and until he entered service he was at the Texas Experiment Station in charge of the dairy husbandry section.

After leaving the service Mr. Harper was placed in charge of the Java Dairy Improvement Association, Java, New York. Under his management this organization became one of the most successful in the state.

In 1920 he was called to the Otsego County, New York, Farm Bureau, and there has produced excellent results in organization projects and breed club work, and has given valuable assistance in consignment sales, tuberculosis eradication, and in developing methods of handling milk commercially when the normal market had been closed.

James E. Harper has entered upon a man sized job. His past achievements speak highly for his capabilities and the Ohio Guernsey Breeders' Association was fortunate to find available a man with his splendid qualifications.—AMERICAN GUERNSEY CATTLE CLUB.

New Champion on Guernsey

Primrose of Courtil Du Ray has established a new record of butterfat production for cows on the Island of Guernsey, by producing in one year, at six years of age, 14,420.5 lbs. milk, 899.48 lbs. fat. This production exceeds the record of the previous champion, Valentine III, by more than 116 lbs.

The new champion is owned by John Gilroy. She has a previous record of 8,853 lbs. of milk, 516.18 lbs. fat begun at the age of 2 years, 122 days. During this test she was fed ordinary feeds and was milked three times a day for two months only, after which she was milked twice a day. She calved within sixteen months after the record was commenced.

The new champion established her record by persistent work throughout the entire year. On the first day of her test she gave 43 lbs. of milk, going up gradually to 57 lbs. and then dropping down slowly to 38 and 40 lbs. of milk a day. Her production on the last day of the test was 29 lbs.

Primrose of Courtil Du Ray is descended from non-registered stock. Her sire was a young bull of Masher Sequel blood lines that is out of a cow reported to have given 60 lbs. daily. The dam of the champion was a high producing cow when still advanced in age, and when 16 and 17 years old she still continued to give a good flow.

STARTLING STATEMENTS of Interest to EVERY FARMER

A. C. Palmer, one of the leading dairymen of Indiana, in an article in a recent issue of Hoard's Dairyman said:

"I believe the fault of pasturing all summer without supplementing feeds is one of the greatest sins of the dairyman and the thing more than all others responsible for decreased milk and butterfat production. I speak from an experience of my own.

"Nine-tenths of the dairymen are at fault in that their cows are underfed, and no small percentage have cows on their farms that are actually starving. To a large extent, this is due to an ignorance of food properties and values as, for instance, a feeling that corn fodder, or corn silage even, and bran make a balanced ration.

"What is grass anyway? What sort of a magic food is it that it should be considered a perfect feed for dairy cows? The answer is that grass is practically hay with water in it, and what farmer that even pretends to keep cows would think of feeding his stock on moist hay all winter. Yet that is all the feed the poor cow usually gets throughout the summer.

"I have heard the argument raised that since grass is the natural food for cows, then, when there is plenty of it, that is all she needs. The answer is that since the production of milk in larger quantity than is necessary for her young is an unnatural function of the cow, unnatural methods must be adopted to produce it. Green grass will furnish the nutrition for a cow's body maintenance, and its appetizing and stimulating qualities will encourage milk production. But all too often the stimulating quality reacts, and by encouraging greater milk production when she does not receive a greater supply of food, her body makes up the difference, so that by the end of grass season her body is weaker than in the spring. Then the dairyman must build her up during the winter months and receive a greatly reduced milk flow while doing it.

"In 1917 I fed my cows until June 10, and, like my neighbors, gave them pasture alone until September 15, when their steadily decreasing milk flow made me hurry feed shipments. But even then the damage was done, and the decrease continued until time to dry them. This year I continued the grain feed throughout the summer, and the same cows, having calved at nearly the same time last year, are giving now over 40 per cent more milk than the season before. Some credit must be given to the improved pasturage conditions this year, but to my mind the biggest reason is the feed they got the past summer is now giving results. And this extra 40 per cent is more than making good the feed the cows ate.

"Feed short in quantity is no worse than feed short in quality. The man who thinks he can winter a herd of dairy cows on a ration of corn fodder or hay and bran, is lacking in the knowledge necessary for his success. This is a business that calls for brains and study as much as any business a man may enter. The problem of percentage of protein, carbohydrates, and fat needed to produce a certain quantity of milk in a cow of a determined weight must be solved if the dairyman is to produce milk at a profit.

"One can't start today with even a perfect ration and expect a big increase next week, or next month. Many cows are run-down; they have been underfed and their systems are deranged. It takes time to get them straightened out and nature working right. It takes from six months to a year to notice the real results that will come from proper feeding of a cow that has been under nourished for years. These things can't be done in days."

And again pointing to the one great mistake made by dairymen, Mr. Palmer says: "And, strange though it sounds, it is a fact that the greater part of the under-feeding on the part of the farmer with pasture comes during the summer months."

The best feed to use during Spring and Summer is

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Ringworm of Cattle

White scab or mange of cattle is comparatively common in the range country. Wisconsin cows are remarkably free from the disease. To be sure the ailment is sometimes suspected by owners or even veterinarians, but in a majority of instances ringworm or some form of eczema is found to be the actual condition present. Scab is an extremely contagious disease, caused by a parasitic mite, and when found has to be reported to the state veterinarian. The United States Bureau of Animal Industry also takes a hand in maintaining quarantines and eradicating the disease. Treatment consists in dipping affected cattle in an approved solution of which lime and sulphur dip is one of the most popular.

In domesticated herds ringworm is the most common and troublesome disease of the skin. It is caused by a vegetable parasite known as tricophyton tonsurans which lives on damp walls and woodwork as well as the skin of animals and man. In modern cattle stables, kept in sanitary condition by scrupulous cleanliness, proper ventilation, and free admission of sunlight, ringworm is becoming less common than it was some 25 years ago. Always it has been most prevalent in dark, dirty, damp, hot, badly ventilated basement stables during winter, and calves are most commonly attacked. In some instances, however, adult cattle are more or less affected, especially upon the withers and region of the croup. Spots may also occur around the vulva.

In calves the disease causes characteristic grey-white, hairless, thick scab or crust-covered spots chiefly upon the face, but in bad cases the body and legs may also be invaded. It commonly starts around the eyes and is particularly obstinate when the upper eyelids are attacked. The spots tend to enlarge gradually, and remain sorest at their borders. Not infrequently the person who treats such cases contracts the disease upon his hands and refers to the ailment as "tetter" or "barn itch". Farm children also frequently have ringworm spots on their faces and sometimes an even worse disease called impetigo, which is a chronic eczema also affecting cattle. Unclean brushes and currycombs tend to spread ringworm from animal to animal in any stable. Rubbing places are also sources of the disease.

To prevent ringworm cattle stables should be put in a perfectly sanitary state in autumn, to do away with the contributory conditions we have mentioned. A thorough application of a mixture of 1 part of compound cresol solution in 30 parts of water, or 5 ounces of formaldehyde or 4 ounces of bluestone to the gallon of water, followed by spraying of walls, fixtures, and ceilings with fresh made lime wash, is also necessary. All rubbing places should also be treated. Paint containing white lead should not be used. It may be licked off and cause fatal poisoning, as cattle are fond of its sweet taste.

Local treatment consists in saturating the bark-like crusts with sweet oil or cottonseed oil daily until they can be readily removed. Tincture of iodin applied twice daily then usually proves remedial in about a week; but this tincture is prohibitively expensive for use on many cattle. Full strength hypochlorite of soda solution may be applied daily to spots on the face or body, and even about the eyes of calves. Iodoform powder should be rubbed into spots on the upper eyelids. We have found a solution of 4 ounces of sulphate of copper (bluestone) to the pint of hot water effective for application to spots and scurfy places on the body. It need only be used once or twice a week.

Advice on Goiter

HOARD'S DAIRYMAN:—In reading the article on "goiter" by H. T. of Castle Rock, Wash., in Hoard's Dairyman of April 8, I desire to pass on some advice which I hope may prove helpful.

Several calves have been born in my herd during winter and early spring months with goiter such as described without variation. We were at first puzzled about the cause or a remedy but, as the calves always seemed thrifty and vigorous, we just left them alone, except to notice that the fleshy bunch did not grow. When they were turned out to pasture the goiters disappeared altogether and in no instance returned. So I would advise H. T. to keep the calf, as she is from a good cow.

Republic, Wash. B. M. D.

Bent Legs

A fine heifer calf was born with her front legs bent. We can straighten them out but she cannot. We can hold them straight with splints, but she cannot get up. Our veterinarian suggested we cut the cords in the back of her legs. I don't see how that could be done.

I have been keeping young stock separated from herd for two years. This young stock has all just passed the tubercluin test with no reaction. I am taking those reactors of the old cows to another farm. When a reactor shows any physical sign of disease I sell her to the shipper. How great is the danger of feeding skimmilk from reacting cows to calves? These that passed the test have all been raised on skimmilk from reactors.

Illinois. F. M. B.

Tenotomy should only be done when a fetlock joint is permanently "knuckled" or "cocked" and cannot be forced into place. It would not, in our opinion, be indicated in the case described, neither is there any certain remedy in such a congenital weakness. Massage the muscles very thoroughly and flex the joints frequently; then apply boots or splints and support calf several times daily with slings. At night, rub compound soap liniment into the muscles. Give emulsion of cod liver oil twice daily; in addition, milk and oat meal and flaxseed gruel. The calf may have rickets.

Such milk should on no account be fed unless sterilized. Under the Bang system of raising calves of tuberculous cows, the calf should be kept absolutely isolated and should not have milk from tuberculous cows. We should not advise depending upon a laboratory test of the milk. Better not use the milk if the test is negative.

Butter Class at Wisconsin Fair

The Wisconsin Buttermakers' Association announces a cold storage butter class for competition at the 1921 Wisconsin State Fair. All exhibits scoring 90 or above will receive a premium, the highest award being $15 and the award for second place is $10. Butter must be received at the cold storage plant in Milwaukee during the week of May 23—28, or it will not be accepted.

Further particulars concerning this competition can be secured from H. C. Larson, secretary of the association, whose office is at Madison.

Jersey Cattle Notes

For week ending April 15:

Number of animals registered: bulls, 283; cows, 641; total, 924. Number of transfers recorded: bulls, 132; cows, 570; total, 702.

A Kansas Ayrshire Leader

HOARD'S DAIRYMAN:—Melrose Canary Bell 2d, owned by Kansas College of Agriculture, now stands as the leading junior two-year-old Ayrshire in the Roll of Honor division, having completed a record of 11,633 pounds of milk and 392.93 pounds of butterfat in 300 days, and carried a living calf for 216 days during this time. While making this record, Melrose Canary Bell 2d was fed largely on silage, alfalfa hay, and mixed grain, as but little pasture is available for the College dairy herd. She stood in a narrow stall, and was milked four times daily during the 300 days of her record.

Melrose Canary Bell 2d comes from ancestry noted for its production. Her dam, Canary Bell, was winner of the French Cup in 1918, and the highest producing cow of any breed in Kansas for several years. Her highest production was 19,863 pounds of milk containing 744.51 pounds of butterfat. In seven lactation periods from time of first calving, Canary Bell produced 95,844.5 pounds of milk and 3,595.47 pounds of butterfat, or an average of 13,692 pounds of milk and 513.64 pounds of butterfat. Six of these seven records are recorded in the Ayrshire Advanced Registry. Three are under mature age. During this time she dropped seven calves, four of which are heifers, and are in the College herd. One daughter that is a full sister to Melrose Canary Bell 2d, won the French Cup in 1917 as a junior two-year-old with 13,785 lbs. of milk and 502.91 lbs. of butterfat.

A TWO-YEAR-OLD CLASS LEADER
Melrose Canary Bell 2nd ranks first in Junior 2-year-old Ayrshire Roll of Honor in the United States. She was bred and developed by Kansas State Agricultural College.

The sire of Melrose Canary Bell 2d is Melrose Good Gift 14612. His eleven Advanced Registry record daughters have averaged 11,113 lbs. of milk and 431.49 lbs. of fat in nineteen lactation periods of 365 days or less, all but five of these records being made at less than four years of age. These include one class leader and two winners of the French Cup, as well as four state record cows in Kansas.

Melrose Canary Bell 2d is an excellent individual from the standpoint of show ring type, showing the rugged constitution and good middle, along with an evenly balanced udder of good capacity. The state of Kansas can well afford to be proud of the Ayrshire herd which has made Kansas one of the leading Ayrshire states of the West.

Kansas. R. B. BECKER.

Health Requirements at Cattle Congress

The 1921 Dairy Cattle Congress, which will be held in its permanent home at Waterloo, Iowa, September 26th to October 2nd, has adopted stringent regulations in regard to the health requirements of the cattle exhibits.

All cattle brought on to the show grounds shall either be from tuberculosis free accredited herds or they shall have passed a satisfactory tuberculin test and found to be free from tuberculosis not more than 90 days prior to the opening date, September 26th. Only tests made by veterinarians approved by both the federal bureau of animal industry and the state veterinary departments will be accepted.

Before the cattle are placed in the barns, each exhibitor will be required to present to the cattle superintendent a health certificate and tuberculin temperature chart showing the results of the last test.

As a further precaution, all exhibition cattle coming from federally accredited herds will be assigned to a certain portion of the barn. The construction and arrangement of the cattle pavilions are such that this can easily be done and still have all the cattle of one breed in the same division, thus in no way detracting from the appearance of the show.

The barns will all be thoroughly disinfected previous to the opening of the show which practice has been followed for the past five years.

Iowa. E. S. ESTEL.

Paint is a preservative as well as a beautifier.

The two inch pipe represents the protein and minerals a cow gets when fed grass only. The four inch pipe represents the protein and minerals in the milk that a good cow gives on green grass only.

How long will the milk flow?

DON'T rob the cows. When stimulated by green grass, good cows give more than they receive, by drawing upon their their own bodies for protein and minerals. But when hot weather comes and the pastures get dry, the cows become exhausted and milk production slumps. The lactation period is shortened, and cows go into winter in bad shape.

Cow Chow will keep the milk flowing

Ask for "ABC's of Milk Making," free.

Make up that shortage of protein and minerals by feeding Purina Cow Chow along with your pasture. It will not only give you more milk now, but it will prevent that sudden falling off of milk in midsummer. In the fall your cows will be in fine condition, prepared for a good winter record.

Look for the nearest Purina dealer. Write us if you don't know his name.

RALSTON PURINA COMPANY, ST. LOUIS, MO.

Ft. Worth, Tex. Nashville, Tenn. Buffalo, N. Y.

Feed from the Checkerboard Bag

"Here's Real Tobacco"

says the Good Judge

That gives a man more genuine chewing satisfaction than he ever got out of the ordinary kind.

Smaller chew, lasts longer—so it costs less to chew this class of tobacco.

And the good, rich tobacco taste gives a world of satisfaction.

Any man who uses the Real Tobacco Chew will tell you that.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 1107 Broadway, New York City

When Writing to Advertisers, Mention Hoard's Dairyman

B.-K. for Ringworm

HOARD'S DAIRYMAN:—I notice a cure for ringworm in an issue of your paper. I don't doubt this disease can be cured by your method, but it is slow and costly. We tried it six months and new cases came up as fast as we got rid of the old ones. We bought a gallon of the B.-K. and took a chunk of gunny sack and went after it with the B.-K. In three weeks there was not a sign of it left and has not been a case of it since. Tell your readers to forget that iodine stuff. You have been printing that ever since I have read your paper. It is as far behind the times as wintering cattle on oat straw.

Oso, Wash. F. J. J.

A Progressive Bull Club

HOARD'S DAIRYMAN:—The Tolland County Jersey Breeders, Inc. was incorporated under the laws of Connecticut about the first of August, 1920. They sell shares at $100 per share. The authorized capitalization is $10,000 and they are using the one vote per herd system.

The object is to breed a higher producing and better typed animal than is now owned in the association.

The requirements for membership are:

1. Testing all cows by Registry of Merit or cow testing association methods.

2. All herds must be tuberculin tested under the U. S. D. A.

3. To use the association bulls.

To gain the object of this association the members have started by buying three Owl-Interest bulls to improve their herds. These bulls were chosen because of their high production, good type, constitutional vigor, and uniformity which are prepotent characters in this family. These bulls are kept on the various members' farms and are controlled by a committee who stipulates the ration and fees and the keep cost of the bulls.

Below is a report of the cow testing association work during the month of February: 105 cows tested; 11 cows producing over 40 lbs. fat; 3 cows producing over 1,000 lbs. milk; 10 cows netted over $25 above feed costs.

The highest producer is owned by Samuel Johnson with 1,193 lbs. milk and 58.45 lbs. fat, making $51.47 above feed costs.

Connecticut. CHESTER C. ALLEN.

LA BELLE KNOLL FARM, Oconomowoc, Wis.

Portage County Guernsey Breeders' Ass'n

2d Annual Consignment Sale

Registered Guernseys and Grade

May 25-26—Amherst, Wis.

WEDNESDAY MAY 25th, 1921.

In the first day offering, Portage County Guernsey Breeders are consigning an exceptionally high class lot of Guernseys. Practically all the consignments are from Federal Accredited Herds, or herds under Federal Supervision.

Much official testing is done in Portage County, and breeders have been very liberal in consigning some of their best Advanced Registry cows, with large butterfat records.

Some of the choice consignments are listed below:

TELLUS NO. 48996 (A. R.) Milk 13,410.3 lbs., butterfat 638.04 lbs. Class A. She has two daughters on test making very good records.

LADY JESSIE'S NORETTA NO. 81668 (A. R.) Milk 6,928.9 lbs., butterfat 408.9 lbs. at 2 years. On retest, in 103 days has produced 3,389.3 lbs. milk, 174.0 lbs. butterfat.

FERN OF GORDONVALE NO. 6997 (A. R.) Milk 8,382.2 lbs., butterfat 395.34 lbs. at 2 years, on retest, in 175 days has produced 6,347.6 lbs. milk, 297.66 lbs. butterfat.

IMP. RASPAIL PETAL NO. 93884, on test, in 108 days has produced 2,632.9 lbs. milk, 132.05 lbs. butterfat in Class GG.

IMP. MADELON OF JEAN DU LUTH NO. 93892, on test, in 57 days has produced 1,663.2 lbs. milk, 81.79 lbs. butterfat.

TWO DAUGHTERS OF ROYALETTE'S STANDARD NO. 20141 (A. R.), sire of 4 A. R. daughters.

IMP. ALEX OF BELLVIEW NO. 4697 (A. R.) Milk 7,788.4 lbs., butterfat 368.0 lbs. at 4 years. Sired by Imp. Souvenir de l'Etiennerie A. R. sire of 17 A. R. daughters.

BETTY B. OF LIBERTY HILLS NO. 63469 sired by Imp. Border Raider A. R. sire of 13 A. R. daughters and full brother to Imp. Itchen May King A. R. Grand Champion National Dairy Show, 1920.

GOLD OLLIE'S SECRET NO. 50996 (Male) Sired by Norwood of Pencoyd A. R. and out of Gold Ollie A. R. milk 10,329.3 lbs., butterfat 551.3 lbs., dam of 3 A. R. daughters.

New England's Milk Market

(Continued from page 660)

which has from time to time threatened to flood the market. Now the breaks in the wall are more serious than ever before, the small leaks of former flush periods becoming so numerous as to endanger the whole structure. With large quantities of milk being sold to much lower markets, the producer who normally turns his milk to butter or cheese is seeking the fluid market. Also, the consumer, aware that the free flow of milk would lessen his monthly milk bill, is not led to increase his purchases at the higher rate. Whether the association can hold its price so far above those for manufactured milk products, and continue to control the flow to its fluid markets remains to be determined. The March price of $.0825 is a drop of $.0075 to meet that of a co-operative creamery organization which sells on a supply and demand basis—without reference to costs.

Producer Owned Companies

New England is turning toward producer owned companies; either for handling milk from the producer to the consumer's door or, at least, to handle the country end. The Plymouth creamery, which is a combination of shippers from several points, is an example. The Turner Center system which has been successful for many years in buying from the producer and distributing has decided to turn its business over to the producer. Payment will be made by deductions from milk checks and will occupy a period of five years. "This," says the N. E. M. P. A. publicity organ, "is in line with the established policy of the N. E. M. P. A. to encourage producer owned co-operative marketing facilities to take over old established distributing systems."

"In these producer owned companies appears a medium for greatly improved milk marketing conditions in New England. Through them the N. E. M. P. A. has fields of service opened which it has thus far failed to touch. Through strong co-operative companies it can make its cost figures valuable in indicating where members can improve their methods—perhaps in showing that some producers can never make "cost plus". Through such companies it can more nearly carry out the full purpose for which it was organized; besides selling to the best possible advantage it may come to increasing its market through well directed advertising and fulfill the need and its declared purpose: to improve the methods of milk production, distribution, manufacture, and use; to encourage the breeding and raising of better dairy stock; to promote the more economical feeding of dairy stock; to promote the legislative interests of the dairy industry; to foster co-operation in agriculture, and especially in dairying; and, in general, to improve agricultural conditions, and bring about a better understanding between the producers of dairy products and the consumers thereof."

Formula for Grafting Wax

Grafting wax, which is needed by farmers and orchardists in spring, may be made by the following formula used at the Ohio Experiment Station:

Melt together until thoroughly mixed four pounds of resin, two pounds of beeswax, and a pound of tallow.

This mixture is then poured into a vessel of cold water. It is then pulled like taffy until it becomes light and smooth. The hands should be greased with tallow for this operation.

The wax may then be shaped into balls and sticks and it will keep indefinitely in a cool place.—Weekly Press Bulletin, Ohio Experiment Station.

Don't attempt to grow a garden under or near large trees that will not only shade the crops but in addition draw most of the moisture and plant food from the soil.

GUERNSEYS

Langwater Traveler

Carries 50 per cent blood of Imp. King of the May, greatest bull of the breed.

His dam is Langwater Lustre, A. R. 806.10 lbs. fat, fifth cow in Class C. She is the second highest testing daughter of King of the May. His sire is Langwater Holliston, sire of Langwater Levity, sold for $6,000.00 and leading cow in Class EE. Traveler's daughters are averaging over 500 lbs. of fat with their first calves. His first daughter to freshen will be a class leader in FF. We offer some excellent bull calves by Traveler out of May Rose cows with fine records. Federal Accredited Herd.

CHICONA FARM GUERNSEYS
A. L. Gile, Prop., Chinook, Washington.

2 Guernsey Bulls

No. 1—A son of Bob Rilma's Monogram, whose dam and sire's dam have records averaging 887.5 lbs. fat. His dam, a daughter of Langwater Hambro, made over 400 lbs. fat in Class G., 10 months old and well grown.

No. 2 is from a 519-lb. cow and sired by a son of Lord Waukesha from a 717-lb. 13-year-old dam. They're priced right and they must be as represented. Write me for further information.

MIDDLESEX MEADOWS FARM

OFFERS

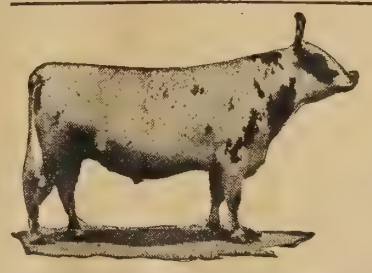
Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.

Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we KNOW you can't get as good as these two for any less money elsewhere.

A. Henry Higginson (Owner). W. R. COUTTS, (Supt.)



South Lincoln, Massachusetts

Pooling Effective in New York

HOARD'S DAIRYMAN:—Toward the last of April there was lacking only three hundred of the required fifty thousand signatures to the Dairymen's League pooling contract. The board of directors voted to pool on May first. The May price for milk was also set but as I understand it there is yet a possibility for a change to be made. A member or two of the conference board of milk dealers from New York City attended some of the sessions of the directors' meeting and this makes it look more as though the price may remain where set at first. Subject then to a possible change, the price for May is $2.30 to the fluid dealers. To one class of manufacturers it is $2.10 and to another it is $1.90. It depends upon the sort of competition that has to be met. The cost of production for May would be $2.39 according to the Warren formula. Butter and cheesemakers are to pay on the market for those products but are granted allowances for manufacture and are charged for skimmilk and whey according to the possible uses that they may make of those products.

It is not stated what percentage of the milk is likely to go into the $2.30 class at this period of the year. As an average it is thought to be 75 per cent but in May it must be considerably less. One can scarcely venture a guess as to what the pooling price may be when all is averaged up together. Many expect that it may be somewhat less than two dollars. I have figured it several times and cannot make it much under $2.10 although it might figure a little less. This is counting the chickens not only before they are hatched but before the eggs are layed. All the same it is not bad policy to look closely ahead and to make due allowances. Whether the price shall be $1.75 or $2.10 or somewhere between, there are certain costs to come out. The usual one cent a hundred cannot now pay expenses. I do not know as two cents will do it.

The League now has fifty-seven plants and that number may need revising quickly. It is true that some of these are small and I think that some are rented, possibly with the privilege of buying. It has been said that there are some two million dollars of certificates issued. If true, the interest on this sum and the fifth that is payable yearly seems to amount to a sum that would require over a cent a hundred on all the milk handled. While one may make wild estimates, yet I cannot see where our alarmists can get ground for the extravagant estimates that they have made of enormous cuts to come out of the milk pooled. It is a time to remain steady. Expenses here will be doubtless more than one can now estimate if outside of close touch with the situation, but any outsider who really gets down to figures should not find anything that can frighten even the most timid. Let us have faith in the good sense of our management and "possess our souls in peace".

It is now evident that when we spoke some two or three years ago of the impossibility of buying out certain big milk dealers and considered it a very impossible undertaking, that we did not know our power to do things. All the same it was necessary to work up to the point of doing big things before we tried to do them. It still behooves us to move slowly if the milk dealers will permit it. We do not want to get the city delivery of milk on our hands if it can possibly be avoided. Some farmers have even now understood that such is the plan with the pooling in operation. They should know better, but still have the notion in more instances than one can readily believe. The Nestle's have driven us to take over property that we preferred to leave alone. It has been necessary in order to protect our members. The same may be said of a few other concerns. It is gratifying to be told also that the Nestle's have withdrawn from the conference board. It means some difficulty with this concern, but it seems to leave the other dealers in a more friendly attitude.

New York. H. H. LYON.

Hollyhock Farms

Consignment to the Wisconsin Holstein Breeders' Sale

May 17, at Milwaukee, Wis

A SON OF MARY SEGIS BEETS, a cow that has proven to be a consistent producer by making as follows:

At 2 yrs. 2 mos.	22.84 lbs.	butter
" 3 "	28.27 "	"
" 4 "	31.82 "	"
" 6 "	32.22 "	"

and has just now completed a yearly record with almost 1,000 lbs. butter to her credit.

His sire is King Pontiac Artis Sadie Vale, a 34-lb. son of the great King Korndyke Sadie Vale, the only bull to have a 40-lb. dam, a 40-lb. daughter and a 40-lb. sister.

His individuality and type will suit you for a herd sire. Why look any further?

One 4-year-old cow, Summit Johanna Texal, just recently completed a senior 4-year-old record of 23.80 lbs. butter from 470.2 lbs. milk with an average per cent fat of 4.272. She combines in a very close degree the blood of Johanna McKinley Segis and Sir Ormsby Hengerveld De Kol and should prove to be a valuable foundation cow. She is an excellent individual, possesses quality and dairy conformation and with the best part of her life before her, is in a condition to go into your herd to swell the credit side of your Dairy Ledger. Bred April 19th to Sir Pietertje Ormsby Mercedes 41st.

2-year-old from Johanna Colantha Prince Pontiac and a 27.68-lb. dam.

Auctioneers — Mack and Krause. Sale Mgr., F. H. Everson, Lake Mills, Wis.

Last Announcement

OF THE

Marathon County Holstein Breeders' Sale

Wausau, Wisconsin

Thursday, May 12, 1921

60 Head of Sorted Registered Holsteins

Will be led on the shavings to be sold at your own figure

Marathon County Holstein boosters have done their utmost to make this sale a profitable venture for you and a "boost" to their County. They want you at Wausau on May 12th—to convince you absolutely that their cattle are right—that their methods of dealing with you are right. If you are interested in acquiring good pure-bred cattle—foundation stock—you can't afford to overlook this sale.

We told you in detail last week of the good things they have to offer you. We told you that the men back of this sale spent considerable time and money lining up these cattle; so come and be convinced that Marathon County is a safe, a good, and a profitable place to buy black and whites.

Remember that the registration papers and transfers in blank will be in the Sale Companies hands prior to sale time; that all animals over six months of age will be tuberculin tested; that all animals will be sold under the 60-day retest guarantee.

Auctioneers—Cook and Krause. Pedigrees—Darcey.

Francis Darcey, Watertown, Wis.

The Son of This 32-lb. 1000-lb. Cow Ready For Service

MARY SEGIS BEETS

He is just past a year old, nearly white, and a splendid individual. His dam, Mary Segis Beets, has twice made over 31 lbs. and has just finished a 1000-lb. yearly record. His sire is King Pontiac Artis Sadie Vale, a 34-lb. son of the great K. K. S. V. Several of his daughters are doing very well on yearly test in our herd. He'll suit you for a herd sire. We guarantee him to be right. Write us about him today or come and see him.

More Profit for the Dairyman

WHILE the market price you receive for your dairy products is, of course, the biggest factor in determining whether or not you are producing at a profit, there are also other considerations that are very important. Take the matter of producing winter feed for your stock for instance. If the cost of producing and harvesting the crop is high, your profits naturally will be reduced in the same proportion. Today, therefore, with a low market, it is more necessary than ever that strict attention be given to the details of feed-crop production in order to keep down the cost and so insure a reasonable margin of profit.

A *Case Kerosene Tractor*—10-18, 15-27 or 22-40 H. P.—will enable you to save time and labor on every operation connected with your crop from plowing the land and planting the seed to harvesting the crop and reducing it to ensilage or other form of feed. This saving all along the line is your best assurance of *safe* and *profitable* dairying, regardless of market conditions.

There are a number of things that enter into the economy and dependability of Case Tractors on all farm jobs. For example, every Case Tractor is equipped with a vertical, four-cylinder, valve-in-head, kerosene burning motor, mounted crosswise on a *twist-proof* frame. Power is transmitted to the drawbar without appreciable loss by means of simple, cut-steel gears, enclosed and running in lubricant. The full power of the motor is available for belt work because the pulley is mounted directly on the crank shaft.

CASE

SILO FILLERS

Case Silo Fillers are built in four sizes: No. 10, 12, 16, 20. They require from 6 to 40 H. P. engines to operate them, according to size, and have capacities ranging 5 to 30 tons of ensilage per hour.

Lowe Brothers

A new way—a quick way to paint your floors

NO need to lug out all the furniture. Just move it over to one side; then paint the other side.

48 hours, and it is all done, and the room in use again. That means 2 days and 2 nights. But you can't do it with "any old floor paint." As sure as preaching, if you try it with anything but Lowe Brothers Hard-Drying Floor Paint, you will have a mess on your hands.

Lowe Brothers Floor Paint is made in a certain way to make it dry quickly, and hard, and still stand wear and tear. It gives a beautiful glossy surface, that can be wiped up same as if it were glass.

It is sold by the one best dealer in each town.

We'll be only too glad to send you a little booklet, called Floor Paint Lessons.

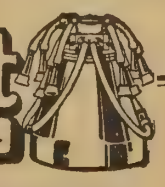
Sanitary, Economical, Durable

MECHANICAL REFRIGERATION

For Creameries, Milk and Storage Plants

Vertical Twin Cylinder Refrigerating Machine.



Modern methods demand better sanitation in creameries, milk and storage plants. The imperfect system of "ice cooling" will no longer answer. Aside from the troubles arising from ice cooling, after the first cost, mechanical refrigeration is more economical. The difference in the cost of operating an ice machine and that of ice to do the same work, will soon pay for the installing of a refrigerating plant. Every creameryman knows the importance of temperature control, not only in the cooling room, but in the cream ripening process. With mechanical refrigeration you have perfect control at all times.

HORIZONTAL machines in all sizes from 6 TONS to 750 TONS daily capacity. If interested write for bulletins.

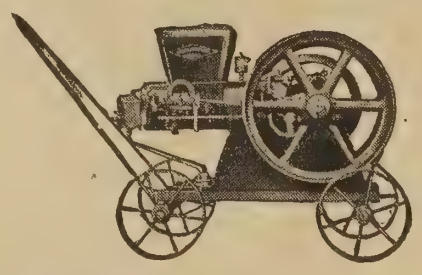
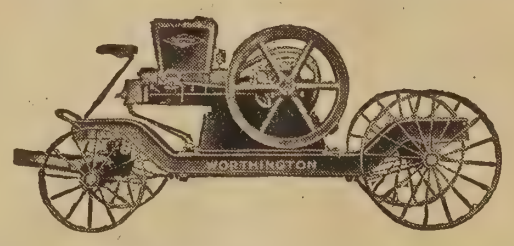
WORTHINGTON

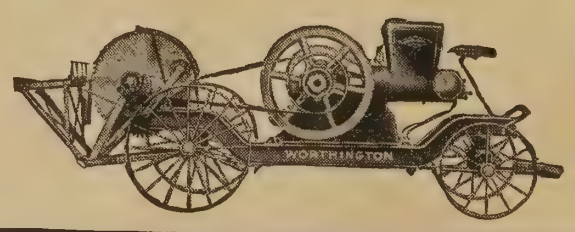
KEROSENE ENGINES



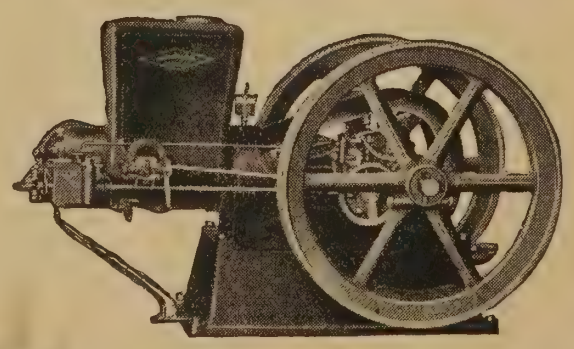
DEPENDABLE AT ALL TIMES



1½ H. P. GASOLINE ENGINE



2½ AND 4 H. P. KEROSENE ENGINE



HAND PORTABLES FURNISHED 2½ TO 6 H. P.

TEAM PORTABLES FURNISHED 6 TO 15 H. P.

SAWING OUTFITS FURNISHED 6 TO 10 H. P.

6 AND 8 H. P. KEROSENE ENGINE

FARMERS everywhere recognize the superior qualities and dependableness of WORTHINGTON Engines. Whether it is the 1½ H. P. for pumping water, the 10 or 15 H. P. for filling the silo, or any intermediate size, the utmost in reliability and satisfaction is always realized.

WORTHINGTON Engines have a practical place in the farm machinery equipment. If you have never used a WORTHINGTON Engine you can hardly realize the satisfaction, the pleasure and the saving in time and money by their use. The smaller sizes help with the chores and do a lot of jobs around the home—quicker, better and cheaper than they can be done by hand. The larger sizes used for larger belt-driven machines do their work in an unusually satisfactory and highly efficient manner.

One or more WORTHINGTON Engines can be used to advantage on every farm. They save labor, the price is right, and the cost of operation moderate. Write today for prices, catalog and other valuable information. Send back the coupon.

Please send me prices, catalog and other information about WORTHINGTON Engines. This, it is understood, puts me under no obligation or expense.

The Engine of Quality and Dependability

WORTHINGTON Throttling Governor Kerosene Engines are the last word in engineering design and the highest standard of quality is maintained. Our modern production methods and great capacity enable us to furnish these superior engines to you at a surprisingly low price.

All sizes from 2½ to 25 H. P. are of the Throttling Governor type and operate successfully on common stove kerosene (coal oil) such as used in lamps and lanterns. Webster Oscillating Magnetos are regular equipment.

A NEW STANDARD OF EFFICIENCY IN THE USE OF MATERIALS

WHEREVER business men gather together today you hear of economies in production—new standards of efficiency for labor, for machinery and in the distribution of finished products.

Reconstruction demands lower production costs and higher relative values.

It demands a new standard of efficiency in the use of materials; and especially true is this in the use of lumber.

It may surprise you to know that the service value of the average purchase of lumber could be increased 100%, if the buyer chose the most practical wood and the most economical grade for a given purpose.

Lumber is more intimately woven into our complex industrial fabric than perhaps any other basic material. In the production of coal, in the manufacture of machinery, in the distribution of countless commodities where we least expect it, lumber touches every home, every farm, every business in the land.

That is why an enlightened lumber service is important in this period of industrial reconstruction and in the great era of home-building that is ahead.

Lumber is capable of the same close analysis as is a bar of steel or a block of concrete.

For years there has been accumulating a mass of close-knit knowledge about the kinds of wood, their service values and adaptabilities.

Few men are aware how well-rounded and scientific this knowledge of lumber is.

The strength of the various species. Their durability. Their service qualities.

What kind of lumber is best adapted to the manifold industrial uses? Which will give the longest service under exposure to the weather? What kinds are most suitable for construction purposes, and what for interior trim?

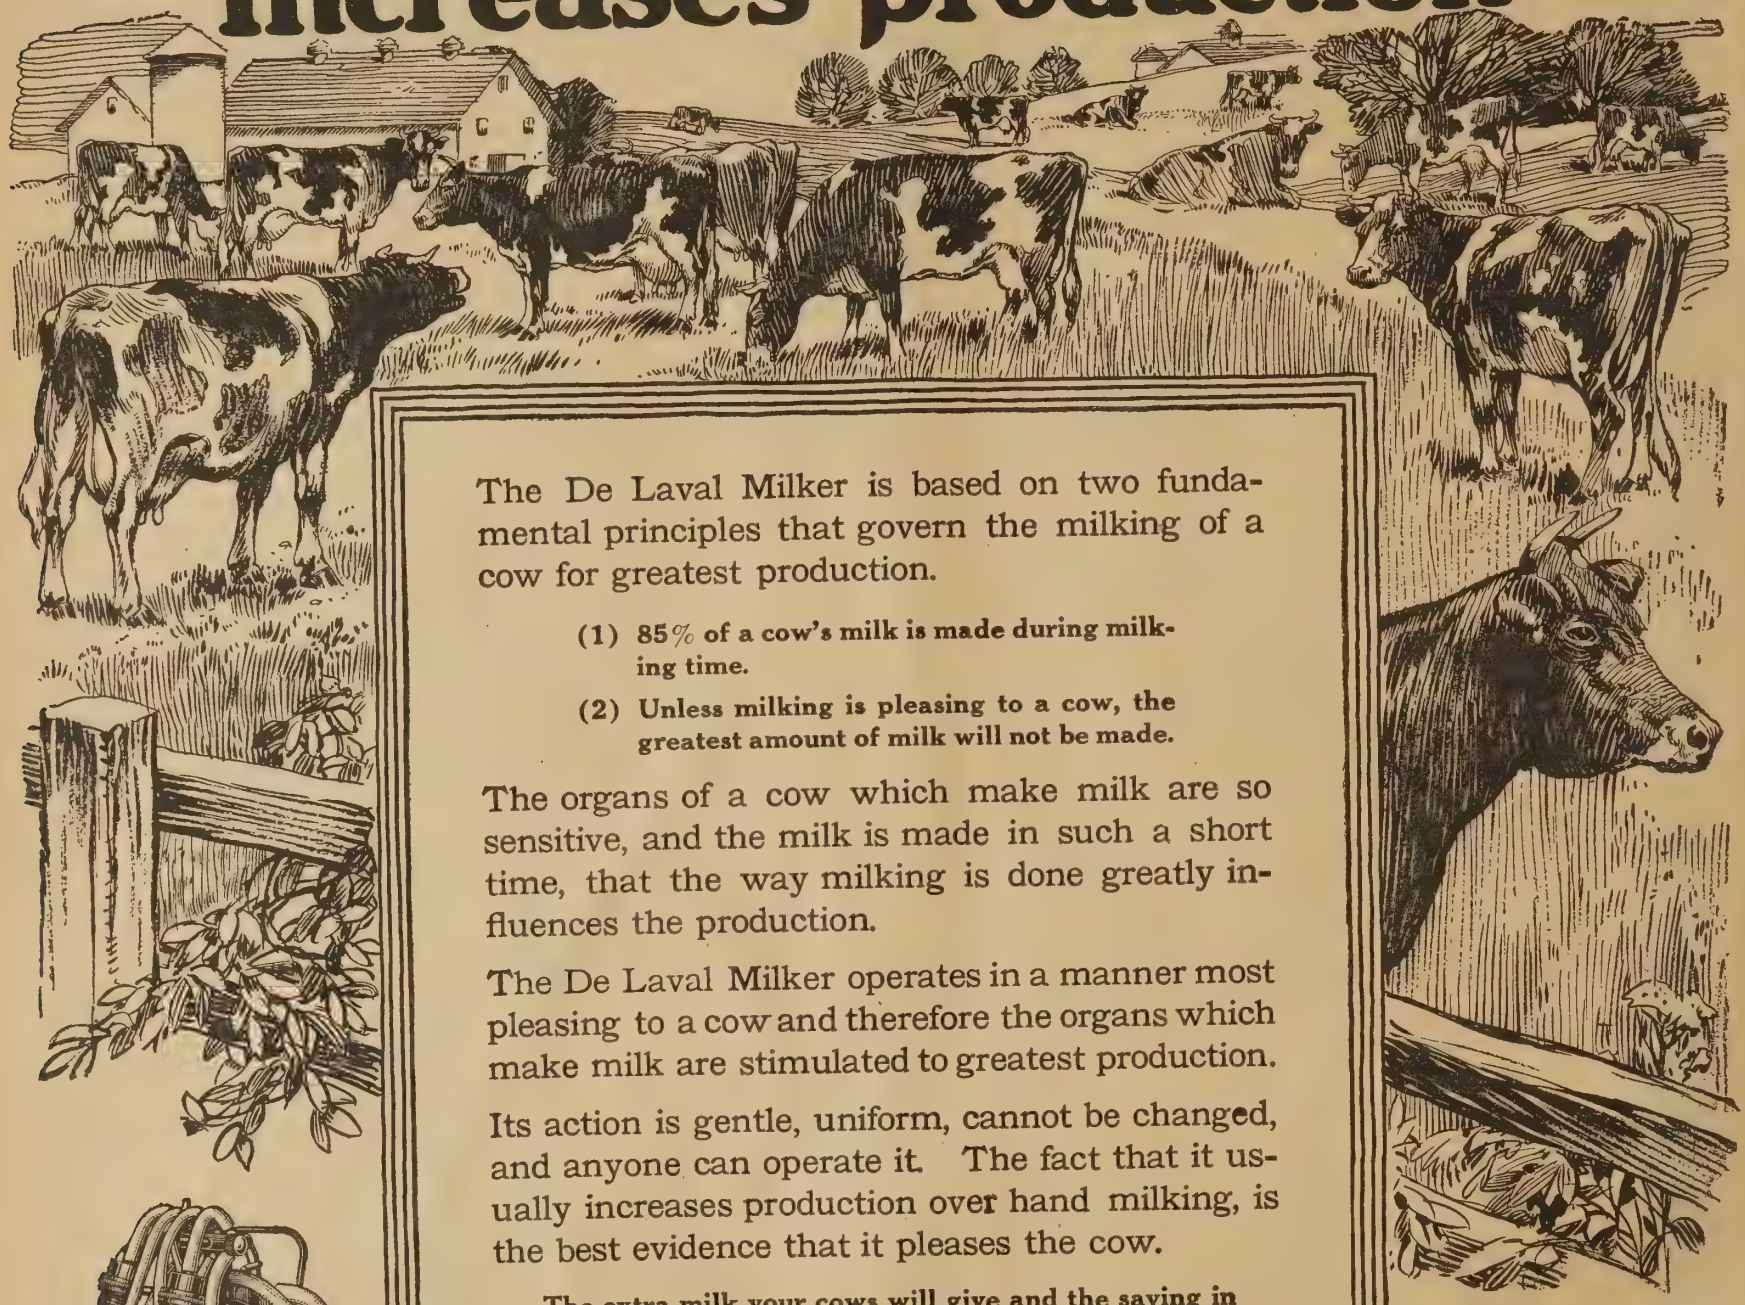
Add to this the advanced knowledge of wood preservation—and you begin to see the far-reaching benefits of this lumber service.

What we advocate is conservation and economy through the use of the right wood in its proper place.

To this end we will supply to lumber dealers and to the public, any desired information as to the qualities of the different species and the best wood for a given purpose.

This service will be as broad and impartial as we know how to make it. We are not partisans of any particular species of wood. We advise the best lumber for the purpose, whether we handle it or not.

From now on the Weyerhaeuser Forest Products trade-mark will be plainly stamped on our product.



When you buy lumber for any purpose, no matter how much or how little, you can look at the mark and know that you are getting a standard article of known merit.

Weyerhaeuser Forest Products are distributed through the established trade channels by the Weyerhaeuser Sales Company, Spokane, Washington, with branch offices and representatives throughout the country.

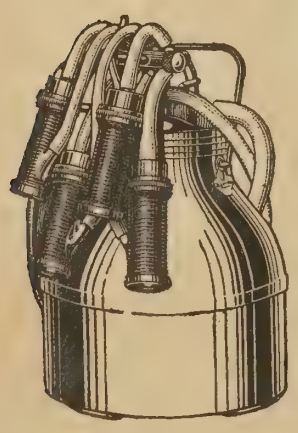
Why the De Laval Milker Increases production

The De Laval Milker is based on two fundamental principles that govern the milking of a cow for greatest production.



(1) 85% of a cow's milk is made during milking time.

(2) Unless milking is pleasing to a cow, the greatest amount of milk will not be made.

The organs of a cow which make milk are so sensitive, and the milk is made in such a short time, that the way milking is done greatly influences the production.

The De Laval Milker operates in a manner most pleasing to a cow and therefore the organs which make milk are stimulated to greatest production.

Its action is gentle, uniform, cannot be changed, and anyone can operate it. The fact that it usually increases production over hand milking, is the best evidence that it pleases the cow.

The extra milk your cows will give and the saving in time will soon pay for a De Laval Milker. It is a better way of milking. Write for complete information.

THE CREAMERY BEAUTIFUL

One of the Best Advertisements for Dairy Products

H. A. BENDIXEN, IDAHO

ONCE upon a time there was a little old shack on the wayside just outside of the town limits. All the people shunned it and the mothers all warned their children to stay away from it, because in the house there lived—not a witch or a ghost, but—the buttermaker, and the old shack was the creamery.

For a mile or more one could smell the creamery and the smell was not of the most pleasant kind. No wonder that a creamery was not allowed to locate within the city limits. Old Sam Brown, one of the town veterans, who would tell you all about the town from the time his father was a boy to the time when this youngest grandson would reach the age of seventy-five, would point with pride to the stately livery barn on main street as the sight of the town, but to mention the creamery would cause him to heave out his last and only chew of perfectly good tobacco. The creamery was a nuisance; it was avoided like a pest.

Good milk, cream, butter, and dairy products in general were as valuable to mankind those days as they are to us today. However, with a lack of knowledge and appreciation of the importance of proper sewage disposal and other sanitary precautions, the creamery of the early days bred flies and disease and old Sam Brown had reason to dislike it.

But times changed. Today in the same town young Sammie Brown, whose grandad never came near the creamery, likes to come around to the buttermaker and mootch a nice cold drink of buttermilk. No longer does the livery barn adorn the best corner on main street, but the creamery has its place and the air around the place is as pure as you find it anywhere. You may not believe it, but it's true.

You step inside the creamery and you find yourself surrounded by bright clean walls, an abundance of light from all sides, and a glistening floor. You are greeted by the buttermaker, a healthy looking chap, cleanshaven and all dressed in white. He takes you around and you see the plant in operation. All the machinery is painted white and you can see that it is white and not partly of a different shading. All sanitary piping is shining and the water and steam pipes neatly bronzed. You can walk the floor safely without landing on grease and you do not hear the churn squeak with every turn of the line shaft. Everything runs smoothly and without a squeak.

Then you turn around, see girls, in white as clean and cute as fairies, wrapping butter, good to look upon (the butter) and tempting enough to eat of. It's all so beautiful and so inviting and you like the looks of things and you buy butter. Then the buttermaker tells you to come again and you take another look at the—butter being wrapped and say you'll come again and you do come again. You never knew you liked butter so well, and you don't mind paying good money for that clean, attractive little carton of bovine bliss, wrapped by fairy hands in the white house of dairydom.

You like to deal at the creamery because the creamery is the pride of the town. A nice lawn and flower beds adorn its front and the ash pile is well out of sight. The windows shine and you can actually look through them. A glossy coat of finish gives the finishing touch to a pleasing building.

Yes, indeed, the author is right who said: "A thing of beauty is a joy forever". Whether in a woman or in the woods, in a house or in a horse, in the front lawn or in a factory, in a piece of machinery or in a pound of butter, beauty is always a joy. You see beauty and you think of quality and where you find beauty as a rule you will find quality. Beauty at times may be as we say "skin deep" or superficial and mean little, but in the majority of cases attractiveness is associated with a good character and high quality.

Look at a man's front lawn and you can almost read his character. What you see on the factory grounds reflects upon the firm's policies. Clean, well planned, and neatly kept grounds outside of a factory indicate the cleanliness, business ability, and reliability of the man inside. On the other hand, a plant shacky and neglected in appearance always suggests bad management and a poor product. In judging by appearance the public is doing nothing unreasonable, especially when it comes to creameries.

There is not a more delicate product than first class creamery butter, and such butter can not possibly be produced in a creamery which is not clean and sanitary in every respect. A buttermaker in a creamery hidden by weeds, ash piles, and rubbish of all sorts is not apt to be very strict about cleanliness inside the plant. The dirt is bound to be carried on to the inside and, all in all, dirt is not compatible with high class butter. An attractive plant, then, as well as an attractive package, without doubt is a great advertisement and advertising pays. Everybody does it and must do it.

Why is it that exhibitors of live stock spend so much time and painstaking work in fitting their animals for the show? The brilliancy of the animal's coat or horns or the fluffiness of its tail adds little to the real worth of the animal. Nevertheless it raises the sale value of the animal and its chances for winning in the show ring.

The color in a piece of candy has nothing to do with its sweetness but it strikes the eye of the child and the child's desire to buy is instinctively increased.

Butter is not an article bought primarily for its beauty. However, there is something about attractiveness in anything that makes you willing to pay and as a rule you are not sorry for what you have bought.

It takes a good man to make good butter and a good man will show his taste in the package and on the front of his plant and in his office as well as in the quality of the product itself. Of course quality is important and with quality where it ought to be no greater market could be found for dairy products than right here at home in the United States. The dairy industry of this country need not look for outside markets, although there are splendid opportunities for export. Consumption of dairy products in the United States can easily be doubled and should be doubled according to the view of our most prominent men on nutrition. All that needs to be done is to advertise.

Advertise Your Product

It is easy to advertise butter and all dairy products, because they are not only attractive but possess the highest food qualities. Little has been done until just lately to advertise dairy products, and shrewd business men who know how to advertise are "getting-by big" with substitutes that are no substitutes. There are no cheaper foods than dairy products considering actual food value. They contain, as we now know, that all-important growth and health promoting fat soluble vitamine, without which animals cannot live. There are only a few sources of this substance and dairy products are by far the cheapest and most available source of all.

If qualities, equal to those possessed by dairy products, could be found in some of the so-called substitutes on the market, the manufacturers of these products would simply flood

NEW HARTFORD CO-OPERATIVE CREAMERY, WINNER OF FIRST PRIZE IN 1920 IOWA CREAMERY GROUNDS IMPROVEMENT CONTEST

Why the Sunflower Makes Good

C. A. LECLAIR, WISCONSIN

THE culture of sunflowers for silage originated several years ago in the dry sections of the western United States. From the outset the crop made so good that many farmers were soon growing it. Now its use has spread so rapidly that eventually every state in the Union where, because of insufficient rainfall or unfavorable climatic conditions, corn is not a sure crop will see its golden smile gazing often and widely from the fields. Unless the unexpected happens, not only the great dry West, but also Minnesota, Wisconsin, Michigan, New York, Vermont, New Hampshire, and Maine and parts of Canada will have as much right to the title of sunflower land as does Kansas. It is the big, single headed sunflower rather than the many stalked weed which is taking these states by storm. As persistently as a Kansan cultivates to rid his fields of the smiley faced weed, farmers elsewhere cultivate to make it grow into one of the most promising fodder crops that can be raised outside of the real corn belt.

There is everything in favor of a steady increase in the popularity of the sunflower as a forage crop. In its ability to produce pounds of digestible and palatable nutrients, it has every known variety of drought and frost resistant corn beat a mile. Let me quote from one of the many enthusiastic growers of the weed, not in the arid West, either, but from humid Cloverland. Mr. Henry Roberts of Michigan, says:

"Here in Upper Michigan we have had so much faith in the cow that hundreds of us farmers got pretty deep into dairying before the problem of getting suitable roughage greatly bothered us. We called on our state experiment stations for help and they did nobly. Frost resistant varieties of corn have been originated but corn in this part of the country can not be depended upon. Unless some brilliant mind can propagate a species that will germinate at absolute zero and stand the temperature of liquid air, we will always have to look elsewhere for material to store for the all essential succulent winter feed. Some of us tried oats mixed with peas.

"The peas were planted deep and early, and the oats shallower and somewhat later so that both had a chance to make maximum growth.

SUNFLOWERS AND CORN ON UPPER MICHIGAN FARM

ENSILING SUNFLOWERS AND CORN ON A NORTHERN WISCONSIN FARM

This succotash we could grow with some success but, unless the proportion of peas to oats was just right and the crops were ensiled at the proper stage of maturity, the stuff was hard to cure. Not until our county agent got us to try sunflowers did we find a crop that actually beat corn for silage."

John Seaquist of Door County, Wisconsin, and hundreds of other farmers of the north central and eastern states could tell this same story. I know a Cloverland seedsman who alone expects to sell more than a ton of sunflower seed. This means that in his territory at least 1,000 acres of sunflowers will be planted.

Feeding Value Equal to Corn

The sunflower is phenomenal in possessing practically the same feeding value as corn. I have known farmers who have had their silos filled part with corn and part with sunflowers who claimed to notice absolutely no difference in the milk flow of their cattle when they switched abruptly from one kind of silage to the other. Cows relish good sunflower silage. Of course, animals accustomed to the corn silage prefer it slightly but the opposite would undoubtedly be true were the conditions reversed.

Carefully conducted tests under the direction of the authorities of the Cornell Agricultural Experiment Station in New York substantiate the evidence of thousands of farmers that the production of butterfat was, if anything, increased by sunflowers when cows were fed on them alternately with corn for equal periods.

In similar tests at the Chatham Experiment Station in Upper Michigan where oat and pea silage was compared with sunflower silage, L. R. Walker, county agent, reports the following:

"Last year at the Chatham Experiment Station they had sunflower ensilage on top of oat and pea ensilage. The sunflowers were fed first and when the change was made to oat and pea ensilage, no difference was noted in the milk flow which was carefully weighed daily. I see no reason why the sunflowers will not work in this vicinity. We have yields this year of twenty-five tons of flowers and will be able to make comparisons with corn this winter, but I feel confident that the comparison will be valuable to sunflowers."

Yields Better Than Corn

Considering that it costs no more to plant, cultivate, and harvest sunflowers than corn these crops have another characteristic in common. In the matter of acre yield, however, the sunflower proves its superiority. In high or low altitudes, on poor or good soil, under humid or arid climatic conditions, with or without irrigation, the sunflower can be banked upon to outyield corn. In fact, other things being equal, it will make on the

(Continued on page 706)

Bob Takes An Inventory

C. E. LADD, NEW YORK

EVERY winter Bob Browning and his wife talked over the farm business, planned what crops should be raised on the farm next year, how many cows they should keep, whether they should start any spring calves, and how many chickens should be hatched. From long experience they knew exactly how much work they could do during the summer. They knew the possibility of obtaining more labor and they understood the producing power of their soil.

One February evening when they were discussing these questions, Helen Browning said to her husband, "Bob, isn't there some way of telling whether our farm business is worth any more this year than it was last year and how much more or less it is worth? We have never figured this out, but couldn't we take a day off some time and really find out where we stand?"

"Well," said Bob, "the groceryman takes an inventory every year and I expect he is able to find out from that just where his stock stands. I don't know why we can't do the same."

The result was that the next day Bob and his wife, after discussing the question long and lengthy the night before, determined to take as much time as necessary and make an inventory of the farm business. This was how it was done.

Bob sharpened his pencil, took down an ordinary account book, which had been partly used for other purposes, and wrote at the top of the page, "Inventory, Browning Farm, 1919."

His first entry was "Farm," The farm had been bought six years before for $8,000. Since that time a few repairs and improvements had been made on the buildings. The land had been steadily improved from year to year and all land in the immediate neighborhood had risen in value. It seemed only fair to suppose that this farm, if placed on the market, could be sold for $9,000. So the first entry was "Farm,——150 acres, at $60 per acre———$9,000."

Next came live stock and first of all the working animals. There were but four horses on the farm, one well matched heavy team which did the brunt of the work, and two extra horses somewhat older which were used either together or singly or in combination with the heavier team. The heavy team was large, in fine condition and six years old apiece. In any market they would bring $500 and were entered at that in the inventory.

The question of valuing the other two horses was more difficult; but from the auctions which had occurred that winter in the neighborhood, it seemed reasonable to believe that Tom was worth $150 and Dick $75. "Anyhow," Bob said, "we can only use our best judgment this year, with no big jump either way, I believe we won't be fooling ourselves much." So the entries were put down:

Horses	
Heavy team, weight 3,000 lbs., 6 years old	$500
Tom, weight 1,300 lbs., 10 years old	150
Dick, weight 1,350 lbs., 14 years old	75
Total for all horses	$725

Naturally, after horses, the cows and young stock came next. Recent auctions helped to give values for the cows, two-year-olds, yearlings, and calves. Moreover, hardly a week passed but that some cattle dealer happened into the barn and talked to Bob about the value of stock, generally making an offer for some cow or cows before leaving. At the milk station mornings the chief topic of conversation, when all other subjects failed, was the price of cattle and the amount that dealers had paid for stock bought during the past week. So Bob and his wife took their account book to the cow stable. Here Helen took the pencil and the book and became the clerk, while Bob went back and forth behind the row of cattle making up his mind as to the value of each one and balancing their good points and bad points so as to attain just the nicety of judgment required to place a fair value on each animal.

"Why don't you group them into classes?" asked Mrs. Browning, "and value them in that way."

The suggestion seemed so reasonable that Bob adopted it at once.

"Well," he said, "there are 15 cows, every one of them sound in all four quarters, of full age so that they are giving their maximum amount of milk and with teeth good enough so that they should all last for years to come. They ought to bring today at any auction $120 apiece and I'd hate to sell them for that if a dealer of-

FALCON'S PROUD WARRIOR

FALCON'S FLIGHT GUERNSEYS

Record Making Which Does Not Interfere With Persistent Production and Reproduction

THOUGH with cows, as with men, it is better to be a "has been" than a "never was", feed bills are paid by "issers" alone. Even a world record cow, great as her past performance may be, is worth only beef prices when sterile. A system of record-making which makes cows "has beens", incapable of reproduction, no matter how large the one year's production, is pernicious, expensive, and no longer acceptable. A record which ends a cow's usefulness should be strongly discounted, and is.

Worthwhile records are those which do not make barren cows of a breed's best individuals; the only worthwhile record cows are those which come back year after year paying a profit by their milk flow, and contributing regularly to the further improvement of their breed by dropping healthy, vigorous calves.

At Falcon's Flight Farm in Connecticut, where Bell-founder—May Rose Guernseys are bred, the first forty-two Advanced Register records completed average 589 pounds of fat —about twenty pounds higher than the first forty ever made on any other Guernsey farm in America. All but three of these cows have dropped calves since the records were finished. One of the three died shortly after the test and the other two are now heavy in calf. During the past four years there have been but three abortions in the herd of 110 females, and federal tests in June, 1920, and January, 1921, show the herd to be tuberculosis-free. Such a health record gives value to a description of this herd and its management.

When the Falcon's Flight herd was started fifteen years ago, much care was exercised in selecting its members. The occasional additions during the following seven years brought only high class animals into the herd's foundation. Since 1913 no females have been purchased. The developments here recorded are entirely from stock owned then, 96 per cent of the present herd of 110 females being bred on the farm. Progress before 1913 was limited by a disastrous epidemic of contagious abortion. The fact that no females have been brought in in eight years is credited with part of the present freedom from disease.

Until 1917 Falcon's Flight Guernseys were maintained as a milking herd and were fed and managed in the manner which seemed practical to profitable production. Calves were allowed to get a bit shaggy haired and roughed it considerably until they came to milking age, but they were breeders. Cows were bred to freshen each year and were fed a wide ration which might not have given immediate maximum production but which was healthful and kept cows in the milking herd year after year.

Changed to Breeding and Record Making Herd.

Four years ago, the plan of the farm changed and what had been only a first-class dairy herd without fame or renown was started on the way to a high rating among the breeding establishments of the country. Instead of working solely for economical milk production it squared away in a breeding plan which is definitely worked out for generations to come. Its accomplishments in this short time have listed it among the breed's leaders.

But the feeding and management luring the "dairy years" have become a habit. So, instead of starting cows on test to "smash records, regardless", care was taken that the cows were not "smashed". In the dairy, the most profitable cow had been the one which made consistent returns year after year; it seemed logical, therefore, that as a breeding institution it wouldn't be the cow that would ring the bell for one year and then fade out that would set the mark but the one which would make her record and drop a goodly number of calves afterward which would do the real business. Consequently a test ration with about 18 per cent protein was used. The basal mixture was 300 lbs. bran, 300 lbs. ground oats, 200 lbs. oil meal, 200 lbs. gluten, 100 lbs. cottonseed meal, and 140 lbs. hominy. Cows which tend to become too thin as the lactation period advances are fed additional hominy and for those inclined to lay on flesh oil meal is added to the basal mixture. On the day these notes were taken fifteen cows on test were receiving an average of 12 lbs. of grain daily and were producing 39 lbs., a little over 3 lbs. of milk for each pound of grain.

An average of 6 lbs. of dried beet pulp was being fed. It is given with the grain mixture dry. It is thought that feeding it wet decreases the quantity of silage consumed and that better results have been obtained when it is supplied dry. When no silage is available, the pulp is fed wet.

Even with this carbonaceous ration a period of six weeks is taken in getting a fresh cow onto full feed.

The Results in Health

Examples of the results of Falcon Flight feeding and care on persistency of production and reproduction are Cassifide and Hoop of Gold, two cows of the original lot purchased. The first lived nearly seventeen years and dropped fourteen calves. At thirteen years she was put on test and made 11,965.4 lbs. milk containing 534.15 lbs. fat. She has four A. R. daughters whose records average 550 lbs. and a son whose first four daughters tested average 554.81 lbs. fat. Hoop of Gold, at seventeen years, is still in producing form and due to calve in August. Such longevity and continued function can result only from healthful care and management.

The fact which changed Falcon's Flight Farm from a place where it was only known that a good dairy herd of Guernseys was maintained to an institution eagerly sought by breeders for breeding stock was the testing of the daughters of Bellfounder, one of the first bulls used on the farm. His daughter, Countess Prue, with her world's record of 1,103.28 lbs. fat, guaranteed the farm a place in the sun. Polly of Falcon's Flight, the full sister of the world champion, both out of Pruette, made 728.79 lbs. of fat on her first test and is at present making a record which should easily give these two full sisters an average over 1000 lbs. of butterfat. Their average last month was 916 lbs. Mononette, bred on the farm, and with a production of 858.11 lbs. fat, has a daughter, Monobelle, by Bellfounder, whose record is 847.64 lbs. fat. The average of these two records is larger than that of any other Guernsey dam and daughter bred on one farm. The first seventeen Bellfounder daughters to complete records average 661 lbs. of fat, and include My Fancy of Falcon's Flight with 979.11 lbs. fat, Monobelle with 847.64 lbs., and Blanco with 806.33 lbs. Daughters now on test promise to bring the average of all above 700 lbs.

Bellfounder for $220

Bellfounder, the bull whose daughters give him a rating among the greatest sires the breed has known, never sold for a record price: he never saw a show ring, and couldn't have won had he been exhibited. At a Florham Farm auction, $220 was enough to take him to Falcon's Flight. Because of abortion in the herd his offspring are limited to those sired after 1912. In 1914, when an old bull, he was sold to another Connecticut farm, and later went to the butcher, "unhonoured and unsung". Fortunately the small number of daughters of this great Guernsey were kept healthy and developed into strong, vigorous cows under the plan of management of Falcon's Flight.

Banzai, also purchased from Florham Farms and used before Bellfounder, was an equally great sire in the opinion of those at Falcon's Flight. Though his daughters were started on test when well along in years, the five with records average 12,874.9 lbs. milk, 667.97 lbs. fat.

The third sire used, Prince of Litchfield, is the son of Cassifide. He was sired by Banzai. His son, Duke of Falcon's Flight, out of Little Duchess, a daughter of Banzai, with 13,616.3 lbs. milk, 655.36 lbs. fat, is in service now. Another successful sire was Raymond's Pioneer of Lewison, eight of whose daughters, all at less than mature age, have averaged 10,282.2 lbs. milk, 528.95 lbs. fat.

Plans for Future

The Bellfounder and May Rose families will be continued in the herd. At present a son of Bellfounder, Choice of Elm Tree Farm, and a double grandson represent that family. The plan is to use a son of certain cows now in calf to "Choice". The May Rose line is carried on through the use of Falcon's Proud Warrior, by Langwater Warrior and out of Pride of Birth, a 644.12-lb. cow with five daughters averaging 552 lbs.

Such richly bred sires will be used in a herd of strong constitutioned, straight topped, deep barreled cows with square, well hung udders—cows developed by a safe, sane plan of feeding and care which has given them strength and vitality for years of heavy milking and dropping calves each year. A statement from the farm well outlines the plan to preserve and improve upon the present characteristics of the herd: "It is the intention to perpetuate these qualities through carefully considered policies of line breeding with an occasional resort to inbreeding where such action seems to be warranted by the animals to be so inbred and the ends to be attained." So well are plans laid for continuing this breeding herd that the statement of Chester W. Adams is well put that, "If two and two were as certain to make four in the breeding of animals as it is in mathematics, the future of Falcon's Flight Guernseys would be assured."

THREE FALCON'S FLIGHT GUERNSEYS, ILLUSTRATING THE TYPE BEING BRED

They are straight-topped, strong constitutioned, deep barreled cows with square, well hung udders. Hoop of Gold, on the left, is seventeen years old and due to calve again in August. My Fancy of Falcon's Flight, center, has a record of 18,214.7 lbs. milk, 979.11 lbs. fat. She is by Bellfounder and is second among his daughters only to Countess Prue whose world record is 1,103.28 lbs. fat. Rose of Falcon's Flight, right, has a record of 11,771.2 lbs milk, 633.11 lbs. fat. She is one of five daughters of Bellfounder now on test which are expected to bring the average of all above 700 lbs. fat.

DO YOU KNOW THAT FRESH AIR IS ⅔ OF A COW'S RATION

IRRESPECTIVE of how well you feed your cows, they are not getting correct nourishment when you house them in improperly ventilated barns, because *fresh air is two-thirds of a cow's ration.*

That's why the U. S. Dept. of Agriculture, the farm journals and stock and dairy experts of the country advocate efficient farm barn ventilation to promote healthy and contented cows and a greater milk yield.

Help Your Cows Produce More Milk With An ILG

FARM BARN POWER VENTILATOR

The ILG FARM BARN POWER VENTILATOR keeps the air in your cowbarn fresh, clean and invigorating. It operates electrically, draws out every trace of foul odors and gasses which arise from dung and excretions. It keeps the hay and grain sweet and fresh, and helps the cattle grow stronger and give more good milk. Made for 32-Volt D. C. and 110-Volt Standard Currents.

Write us for literature. Or ask your hardware or electrical dealer for a demonstration.

*Over 50 lbs. fat.

Association Notes

Wyalusing, Pennsylvania:—This association has been selling grades and buying pure-breds. All members use pure-bred bulls. They have just started to buy co-operatively and are pleased with the saving. During March, market milk testing 3 per cent sold for $2.10 per cwt. Milk retailed for 10c per quart. Bran sold for $38 per ton; cottonseed meal, $44; gluten, $44; corn and oats, $38; distillers grains, $33; linseed meal, $34; oats, $40; hominy, $39; Unicorn, $30; corn meal, $38.

Troy, Pennsylvania:—The condensery paid $2.00 per cwt. for milk. The creamery paid 50c—56.8c per pound for fat. Prices of feed are as follows: cottonseed meal, $2.25—$2.65 per cwt.; wheat feed, $2.25; corn meal, $1.70—$2.00; oil meal, $2.40—$2.65; hominy, $1.70—$2.00; bran, $2.00—$2.20; barley, $1.70—$2.00; gluten, $2.25; middlings, $1.70—$2.25.

Canton, Pennsylvania:—We have 534 cows in the association of which 171 are registered. We have 68 pure-bred Shorthorns, 58 pure-bred Holsteins, 43 pure-bred Jerseys, and 2 pure-bred Guernseys. During March market milk sold for $1.98 per cwt., the required test being 3 per cent. The creamery paid 55c per pound for fat. Milk retailed for 12c per quart and butter for 55c per pound. Cottonseed meal sold for $44 per ton; oil meal, $50; gluten, $44; wheat bran, $39; corn meal, $34.

Towanda—Wilmot, Pennsylvania:—During March, market milk testing 3.3 per cent sold for $2.10 per cwt. Four cents were paid for each point above. Feed prices are: gluten, $48 per ton; ground oats, $41; corn meal, $37; oil meal, $50; cottonseed meal, $42; Unicorn, $54; Pioneer, $53; bran, $37.

Coshocton County, Ohio:—Market milk testing 3 per cent sold for $4.20 per cwt. during March. The condensery paid 52c per pound for fat and the creamery, 52c. Milk retailed for 14c per quart and butter for 50c per pound. Hay sold for $12 per ton; bran, $32; corn, 70c per bushel; oats, 50c; cottonseed meal, $1.50 per cwt.

Empire—Osceola, Wisconsin:—Another registered Holstein sire has taken the place of a scrub bull. Four registered Holstein bulls were sold by members. The creamery paid 60c per pound for fat and the cheese factory 58—62c. Silage sold for $8 per ton; alfalfa and clover hay, $16—$20; bran, $29; oil meal, $48; cottonseed meal, $50; gluten feed, $45; barley, $30; oats, $26; corn, $30.

Monticello, Wisconsin:—During March market milk testing 3.7 per cent sold for $2.20 per cwt. Six cents were paid for each point above. The creamery paid 45c—50c per pound for fat. Milk retailed for 10c per quart and butter for 50c per pound. Bran was priced at $28 per ton; alfalfa hay, $28; oil meal, $50; silage, $6; hominy, $28; oats, 50c per bushel.

Southwest Virginia, Virginia:—Four unprofitable cows were sold this month. The creamery paid 45c per pound for fat. Milk retailed for 14c per quart and butter for 60c per pound. Larro sold for $75 per ton; bran, $40; cottonseed meal, $40.

Byron County, Wisconsin:—Twenty-three members have finished a year's tesing. Their herds included about 400 cows. Seventy-eight cows were sold during the year, 27 for breeding purposes and 51 as boarders. Forty-nine cows qualified for the Register of Production, having made 365 or more pounds of fat.

S. A. Smith owned the high cow in the association, a Holstein, Oakfield Johanna, which made 15,945 lbs. milk containing 607.5 lbs. fat.

Some good figures were collected to indicate the profits from liberal feeding of concentrates. A herd which was fed $36.87 worth of grain per cow made a return above feed cost of $123.43. One in which $49.59 worth of grain was fed made a net return over feed of $118.16. A herd

The five grade Guernsey cows shown here are from the herd of 17 owned by F. D. Breitrick & Sons, Wisconsin. This herd led the Ellington Testing Association in the year ending April 1, 1921, with an average production of 7,375 lbs. milk, containing 343.4 lbs. fat and a return over feed cost of $138.92 per cow. The herd has association records for two previous years, the average for the first being 302.1 lbs. fat, and, for the second, 318.8 lbs. Each of the five cows shown made more than 400 lbs. of fat last year, the average being 440.7 lbs. Matthew Nelson is the association tester.

which received only $20.39 worth of concentrates per cow made a return over feed of $89.92 and in one where only $15.24 worth of feed was fed the net return over feed was only $70.11.

The highest herd in the association was that owned by Henry L. Weber, containing 20 registered Holsteins which averaged 10,721 lbs. milk containing 375.8 lbs. fat.

Feed, Care, and Study

Herd Average Increased by 100 lbs. Fat

"As members of the Cedar Grove, Wisconsin, Cow Testing Association for the past three and one-half years," say Huenink & Lubach, owners of Wisconsin's champion cow test cow, "we have obtained some profitable results. When we started our herd averaged 11,829 lbs. of milk and 410.2 lbs. of butterfat, while the last year our average was 13,757 lbs. milk and 502.2 lbs. butterfat.

"We were encouraged by our tester to mix our rations before feeding and to milk some of our cows three times a day. In one instance this gave an increased production of over 3,000 lbs. of milk.

"Another problem our tester helped us solve was our calf feeding. He encouraged us to mix a good calf ration and our calves have grown as much as two and a half pounds a day.

"Another item we must not forget is that testing showed the difference in the profits of the several cows Some of the cows made as much as two and a half times that of other individuals.

"It was through the tester's suggestion that we started with purebred cattle in earnest, which some day is going to give us a good purebred herd.

"Testing showed us that we had sold a registered bull to be slaughtered that had five daughters that averaged over 13,300 lbs. milk and 525 lbs. of butterfat. A lesson like this one we will remember a long time. Our association work helped us to feed and care for our cows, and then study the results obtained."

Holstein Wins Kansas Trophy

HOARD'S DAIRYMAN:—The loving cup, offered annually by the Kansas State Dairy Association, was awarded to the Holstein cow, Lillian Korndyke Sarcastic, who made the highest semi-official butterfat record in the state of Kansas during the year 1920. Lillian Korndyke Sarcastic is a registered Holstein bred, owned, and developed by Mr. T. M. Ewing.

Her record is 23,335.2 lbs. of milk and 780.1 lbs. of butterfat, which is equivalent to 975.13 lbs. of 80% butter. During the year Lillian was milked four times daily for the first two months, and three times per day for the remainder of the year. Her ration consisted mainly of silage, alfalfa hay, and mixed grain, with some pasture. She was kept in a roomy box stall, and turned out with the rest of the herd for exercise and pasture.

This cow was just eight pounds of butterfat above the cow who won the cup in 1919. Lady Volga Colanthus 2d, the 1919 winner, and the first cow in Kansas to produce over 20,000 lbs. of milk in Kansas, completed a record of 24,638 lbs. of milk and 771.78 lbs. of butterfat.

Lillian Korndyke Sarcastic, winner of the Kansas trophy for the highest butterfat production in 1920.

The breeding of this cow is worthy of note, as she is a maternal sister to Irene Sarcastic De Kol, the Kansas cow that won grand championship at the Missouri, Iowa, Nebraska, and two Kansas State Fairs, as well as winning second place at the 1920 National Dairy Show at Chicago. The sire of Lillian was Wauseona King Korndyke who is now owned by McConnell Brothers, Kansas. The dam of this bull produced 16,174.1 lbs. of milk and 612.17 lbs. of fat or 765.21 lbs. of 80% butter in a year. His sire is Sir Korndyke Queen who has 40 tested daughters and is a son of Pontiac Korndyke.

Several daughters of Wauseona King Korndyke have been tested for yearly production, and all have made good records. These include Queen Mahomet Colanthus who produced 15,656 lbs. of milk and 578.34 lbs. of butterfat in 305 days as a junior three-year-old.

Kansas. R. B. BECKER.

The fortunate people—the truly fortunate—are not so much those who succeed in life as those who succeed in living.—E. S. Martin.

We had an old horse named Barneo,
He died when he swallowed a cameo,
They made boots from his hide
Both narrow and wide,
And the rest was made into oleo.—Ex.

DODGE BROTHERS
MOTOR CAR

The reliability of Dodge Brothers Motor Car is almost always referred to when its name is spoken

It seems to stand as a symbol for the car itself—a symbol which everyone knows and recognizes

People speak of the car's economy and efficiency with high praise, but they speak oftener and with even greater enthusiam of the way it can be depended upon

The gasoline consumption is unusually low
The tire mileage is unusually high

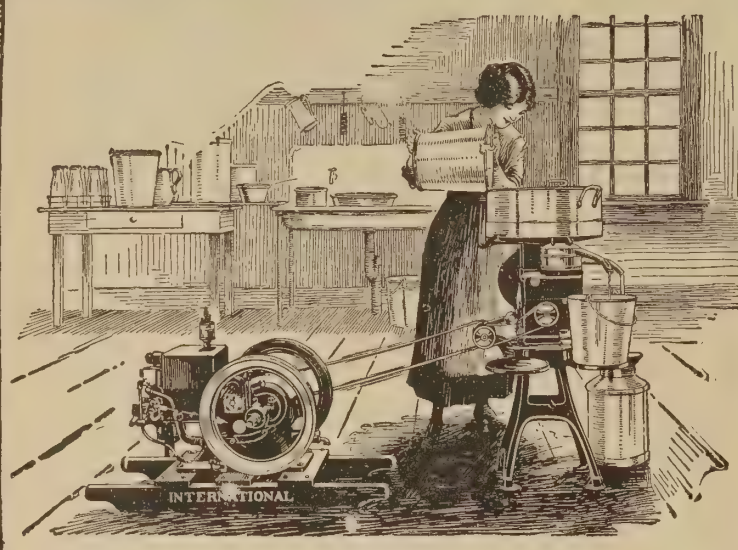
DODGE BROTHERS, DETROIT

"PELOUZE" Dairy Scales

Three Sizes: 40, 60 and 120 lbs. by Tenths of a Pound.

Guaranteed Accurate

Made to comply with Departments of Weights and Measures. Large Circular Dial, with distinct, black figures and graduations. Patented adjustable hand for obtaining the tare weight of empty pail.



Order direct or through any leading Dairy Supply house. Specify "Pelouze."

Primrose Prices Down!

Go over these Primrose details again —then see the International dealer

PRIMROSE is the only cream separator with two wide-open cream outlets that are never restricted in size. The regulating screw is in the skimmilk outlet. It is easy to adjust because it works on the large volume of skimmilk instead of on the small volume of cream.

In the Primrose, oil is forced through the bearings and not just to them.

It is the only separator in which the dirty used oil is turned out automatically when new oil is poured in.

Primrose separators run easily and steadily, skim with exceeding closeness, and serve their owners reliably for many years. Direct power drive and electric motor drive equipment available. Built in four sizes with capacities ranging from 350 to 850 pounds of milk per hour.

Primrose quality may now be had at lowered prices. Take advantage of Primrose lower price at the stores of the International dealers.

Why the Sunflower Makes Good

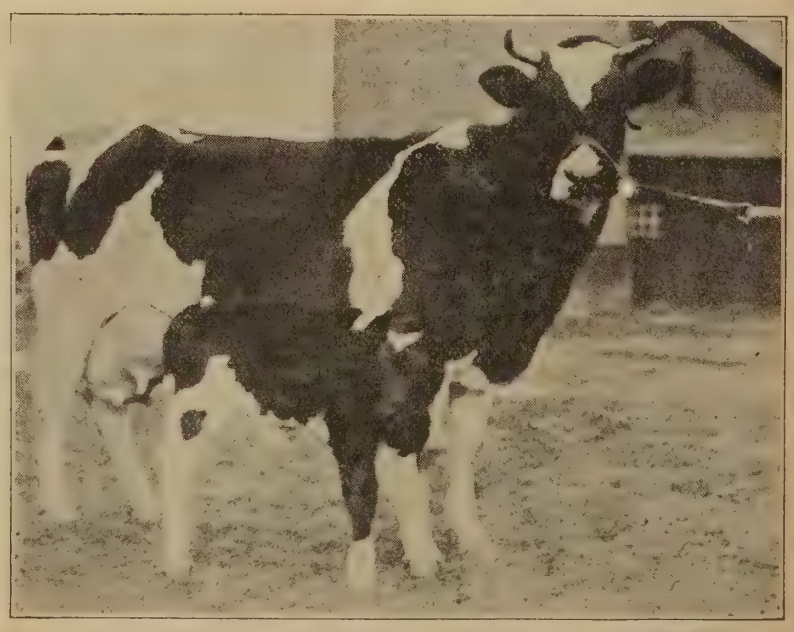
(Continued from page 702)

average twice as much feed as corn. Under the most favorable conditions, sunflowers have been known to yield as much as fifty tons of ensilage to the acre. At the Oklahoma Agricultural College, Professor Blizzard reports yields of five tons of sunflower silage on land where corn and kaffir burn up. He says: "On the poorer Oklahoma farms sunflowers will be an important crop in the future in making beef."

Comparative yields of sunflowers and corn are reported at the Nevada and Nebraska Agricultural Experiment Stations. At the Nevada Station the yield of corn was 14 tons per acre to 23 tons for sunflowers, and at the Nebraska station the yield was 17 tons for corn and 23 tons for sunflowers.

Early at Both Ends

The sunflower owes its drought and frost resistance to the fact that it may be planted earlier and harvested later than corn. Sunflowers can be planted in the spring just as soon as it is possible to get on the land. The young plants will withstand the late frost which may ensue. On the other hand, I have seen sunflowers unharmed by frost on the farm of Mathew Lochen, Delta County, Michigan, during the past season while corn and other crops in adjoining fields were completely frozen. Exceptionally heavy freezing weather may make sunflowers nod their heads but rarely is it ever cold enough before they are harvested to prevent them from again looking up to the sun. This ability of the sunflower to withstand cold enables it to even beat the most resistant types of corn which have so far been developed when it comes to making a heavy yield of fodder during unfavorable seasons. When it comes to withstanding dry weather the sunflower again has it all over corn. When corn wilts for lack of moisture the entire plant collapses. Sunflowers under the same conditions lose their lower leaves in succession but the top remains green. This enables the plant to continue growth as soon as sufficient water again becomes available.



Culture of the Crop

In general the culture of sunflowers for ensilage is practically the same as that for corn. The seed, usually the giant Russian, single blossomed variety, is planted either in hills or drill rows with a corn planter. Some farmers plant and ensile sunflowers only. Others ensile a mixture of sunflowers and corn. In the latter case the two crops are either planted separately or together.

Mr. A. Johnson, Door County, Wisconsin, is one of a large number of farmers who puts a mixture of corn and sunflowers into the silo with the idea of insuring plenty of material to feed in seasons when corn does not do well. Mr. Johnson uses the plate with the smallest holes in his planter box and then sows a mixture of seven pounds of corn to one pound of sunflower seed. Planting in this way his silage is about two-thirds corn and one-third sunflowers.

Sunflowers will grow well on any soil that will produce corn and on many soils which will not. Although not so particular regarding the fertility of the soil as corn, sunflowers nevertheless respond to manuring and good culture. Because they are planted as early or earlier than corn it is best to have the land fall plowed. It should be thoroughly disced and harrowed before planting is begun. Even then there is some chance that the planting will be too thick rather than otherwise for the seed is somewhat smaller than corn. It requires from two to twenty pounds of sunflower seed to the acre, depending upon the fertility of the soil and the thickness of stand it will support. After sunflowers come up they should be harrowed like corn and later cultivated with an inter-row cultivator. As the plants advance in growth, care should be taken not to cultivate too deep, for sunflowers have an enormous number of fine feeding roots which ramify the ground close to the surface of the soil. If these are torn or bruised it is bound to prevent a maximum growth of the crop. Because of their rapid growth sunflowers can be "laid by" considerably earlier than corn. They then need no further attention until the time comes to harvest them. Sunflowers should be cut for silage when most of the seed is in the advanced milk stage and before the leaves begin to dry up and the stalks of the plants get too woody. Like corn the sunflower is subject to few disease and insect pests. Occasionally sunflowers are hit by rust which reveals itself, around the middle of August or later, by a dropping off of the leaves of the plants. When rust occurs the crop can be saved if cut before the disease gets any headway.

Sunflowers are not any more ex-

KING ESTHER LUCY PIETERTJE, HOLSTEIN COW OWNED BY PENNSYLVANIA STATE COLLEGE

February 6th she dropped the calf shown with her. It weighed 142 lbs. at birth. This is held to be a record weight for the state. The dam completed a record of 14,047.5 lbs. milk, 549.4 lbs. fat on January 3rd, which makes her fourth highest junior four-year-old in the state.

haustive of the fertility of the land than is corn. Oats generally do fine on sunflower stubble. Hence the crop works excellently in the average stockman's rotation. Unlike corn few farmers who grow the crop for ensilage can afford to raise their own seed although this can be done. When sunflowers are desired for seed they must be planted much thinner than when raised for silage. This necessitates a special seed plot. The threshing of sunflower seed also presents a problem so that all in all it is found most economical in the long run to depend upon seedsmen for the farm supply of sunflower seed. There are certain parts of this and other countries which are particularly adapted to sunflower seed production and it is from these sources that seedsmen draw their stock. As previously stated the amount of seed required per acre is not large and the price is comparatively low so that there is nothing to hinder a wider use of this valuable crop not only beyond but within the outer fringe of the corn belt. Since this vast area of country comprising more acres than the corn belt proper is distinctly adapted to the husbanding of animals it undoubtedly will be a long time before a crop will be discovered which can beat the sunflower to fill its many silos.

Although corn has always been looked upon as the king of silage crops in sections where it is adapted, the wave of the chinch bug northward in the great corn states has made farmers in certain sections actually abandon its culture. So far the sunflower has been immune to the ravages of the chinch bug and it is rapidly supplanting corn where the latter can no longer be grown.

How He Avoids Moldy Silage

HOARD'S DAIRYMAN:—Last year I found conditions in my silo pit similar to those of L. P. B. of Idaho. As the precautions I took last fall eliminated all mold, I will give you information which may be of some help to you.

I have a 26x12 foot, one piece stave silo on a cement walled pit eight feet deep, built in 1919. The pit has a cement floor without drainage. Where the staves join the pit, you probably have a shoulder of about two or three inches, same as mine. On this shoulder, I built a liberal run-off to the staves using pulp plaster and, as the cement wall in the pit was quite rough, I applied liquid cement with a whitewash brush. The liquid was of the consistency of cream. Applied this mixture for a few feet and then went over it again with plain water which gave the wall a surface smooth as glass. The floor was treated in the same manner. As we went up, in filling, we sealed all doors with the same pulp plaster. Don't think clay will answer the purpose. It won't. The settling silage will take it along down and defeat its purpose. Pulp plaster will stay "put". So much for the preparation of the silo.

Now for the filling. I think no hard and fast rules can be laid down and that you are thrown on your own judgment. For a guide I will give you my experience. My corn was very ripe and hard and stalks exceedingly dry. I placed a Fairbanks Morse horizontal force pump with a two horse engine next to my water tank which holds eight barrels of water. I conducted the water into silo through a garden hose run over the top of silo and entered distributor pipe at last section. Then I made a nozzle from a piece of gas pipe flattened at one end just enough to deliver a good coarse spray. With the pressure I had, the water was distributed evenly throughout the silage. One man handled the distributor pipe and hose with ease. We made no attempt at packing until evening. As help was unobtainable, two of us did all the work and could put in only five feet in a day.

In the evening after chores, we added another tank of water and tramped it down well. By that time all silage was well soaked and packed as hard as a board. We kept this up from day to day until the silo was full. Then we put on four tanks of water for good measure and weight. Every five feet of silage got thirty-three barrels of water exclusive of the four tanks of water put on the top. The result was that when we opened the silo November 1st, we found a wagon box full of rotten silage on top and the rest the finest and brightest stuff you ever saw, way down to the last shovelful. No mold anywhere.

Oconomowoc, Wis. F. C. G.

Willys LIGHT

JUNIOR

Only $295

Rock Bottom Prices are Here

EVERY home in North America can now afford electricity. The demand for lower prices has been met. Never before in the history of farm light and power have such values been offered. Think of it! A standardized electric light and power big enough for light and small power for only $295.

This price is only possible at this time because of intensive effort directed to engineering and production plus a determination on the part of Auto-Lite to meet the farmer more than fifty-fifty on price reduction NOW. Rock-bottom prices are here.

Willys Light Junior is a smaller plant. In every other respect it measures up to Willys Light in quality. It is air-cooled, has the wonderful Auto-Lite engine generator and standard voltage. Willys Light Junior puts electric light and power within the reach of every one.

600 Watts—32 Volts—80 A. H. Battery, $295; 160 A. H. Battery, $365; 240 A. H. Battery, $435. All prices F. O. B. factory.

Willys LIGHT

Power and Light with the Quiet Knight

Now $525

THIS extraordinary reduction in the price of Willys Light is but further proof of the Auto-Lite ability to produce quality products on a quantity basis.

This famous plant is equipped with the Willys-Knight sleeve-valve engine that improves with use, an exclusive superiority. In addition Willys Light has fifty distinct advantages.

Its wonderful record of success in making home life brighter and farm work lighter, together with its remarkable *new low price,* warrants you in buying now.

There is a dealer near you ready to serve you.

1,250 Watts—32 Volts—160 A. H. Battery, $525; 240 A. H. Battery, $595. All prices F. O. B. factories.

Before It Happens

"BUT, Doc., I can't lose that cow. She's the best producer I've got. Five hundred dollars wouldn't buy her."

"Can't help it, George; there's only one way to treat a broken leg. I'm mighty sorry, but that smooth stall floor has done the business for her."

Even if your cows escape a broken bone, slips mean strains and injuries that interrupt production, induce abortion and frequently cause irreparable damage.

The security they afford against slips and falls is one of the outstanding merits of

Ⓐ Circle A Cork Brick Ⓐ
FOR STALL FLOORS

The cork in them grips the hoofs. Whether wet or dry, cows don't slip on cork brick floors. It's simply a matter of insurance of the best kind—insurance that prevents rather than pays for damage done. Circle A Cork Brick in your stall floors will protect *all* of your cows for very much less than an accident to *one* of them might easily cost you.

Do you believe in insurance? Send for the 28-page book, "Better Stall Floors," and learn what other progressive dairymen and breeders think of Circle A Cork Brick. The book and a sample without charge—just send your name and address.

Armstrong Cork & Insulation Company 112 Twenty-fourth Street PITTSBURGH, PA.

Live Stock Owners Seek Funds for Tuberculosis Eradication

In order that tuberculosis-eradication work may be continued, Secretary of Agriculture Wallace, at the urgent request of members of Congress and others interested in the live stock industry, has asked that an emergency fund amounting to $405,000 be included in the deficiency bill of the present Congress, to be used in the payment of indemnities for tuberculous cattle. It is estimated by the Bureau of Animal Industry that this amount will be necessary to carry on the slaughtering of tuberculous cattle until June 30, the end of the present fiscal year.

"For the present fiscal year," says the secretary, in requesting the deficiency appropriation, "$800,000 was provided in the agricultural appropriation act for operating expenses in the eradication of tuberculosis, and $680,440 for the payment of indemnities for tuberculous cattle slaughtered. On account of the number of reacting animals found, the sum provided for indemnities is practically exhausted."

There remain sufficient funds to carry on the operating expenses for the remainder of the fiscal year, but, because the fund provided for indemnities is exhausted, it has been necessary to discontinue the testing of new herds. If the emergency fund asked by Secretary Wallace is passed in the deficiency bill, the eradication work can continue without serious interruption.

"For the first 8 months of the present fiscal year," the secretary continues, "there were found by the tuberculin test 32,424 tuberculous cattle; whereas for the same months of the previous year there were found only 18,273 reactors. This is not an indication that tuberculosis is on the increase because there were tested, from July 1, 1920 to February 28, 1921, 792,398 cattle with 4.1 per cent of reactors; whereas during the previous year for the same months there were tested 419,376 cattle with 4.3 per cent of reactors.

"Another fact that should be taken into consideration is that the market value of cattle has decreased to an extraordinary degree, in fact the salvage received from the sale of tuberculous cattle was approximately twelve dollars per head less during these eight months than during the previous fiscal year, thus making it necessary that the department pay a larger percentage of indemnity than heretofore.

"It is estimated that for the balance of the fiscal year there would be condemned for tuberculosis 13,500 cattle, and at an average rate of indemnity of $30 per head the total claims for federal indemnity would amount to $405,000. Therefore, this additional sum would be necessary to keep the work going along uninterruptedly to June 30."

Under the present practice the federal government pays not exceeding one-third of the difference between the appraised value of the reactor animal and the salvage obtained therefrom, the maximum amount payable from the federal appropriation in any case for a grade cow being $25 and for a pure-bred $50. The remainder of the loss due to the slaughter of an animal for tuberculosis is borne by the state or county alone or by the state or county and the owner, depending upon the law in the state where the animal is slaughtered. That the various states are alive to the importance of the tuberculosis-eradication work is shown by the fact that the 36 states, in which

legislatures have been in session since January 1, have appropriated nearly $4,000,000 for this purpose, and nearly $775,000 as emergency appropriations.—U. S. Dept. of Agriculture.

Western Dairy Notes

HOARD'S DAIRYMAN:—The Lewis-Pacific Dairymen's Association is now operating their $250,000 utility plant at Chehalis, Washington, where they are processing in the neighborhood of 100,000 pounds of milk daily. The plant is equipped to manufacture butter, cheese, powdered milk, and facilities will soon be provided for evaporated milk so that immediate advantage may be taken of any change in the market conditions of any of the respective dairy products.

The plant is owned exclusively by the 700 dairy farmers comprising the membership of the association and shipping their product to the plant.

M. C. Hong of the Stillaquamish Cow Testing Association reports that 475 cows finished the year test and averaged 6,715 pounds of milk and 292.40 pounds of fat. The highest producing herd was that owned by the Valley Gem Farm, consisting of twenty-four Guernseys, which averaged 8,870 pounds of milk and 412.40 pounds of fat. The six high testing herds have all been in the association since 1917, while the six low testing herds have held membership in the association for but one year.

The Washington State Department of Agriculture, through the Dairy and Live Stock Division, is instituting a campaign among the dairy farmers of the state, especially cream shippers, for the production of a better and higher standard product. In their circular it is stated that when a customer purchases a pound of poor butter or butter which is "off" in flavor the consumption of oleomargarine and other butter substitutes is encouraged, consequently it is to the best interests of the dairyman to produce a high standard of cream.

Dr. R. J. Donahue, former chief of the dairy and live stock division of the Washington State Department of Agriculture, has returned to the state service and has been assigned to duty in Eastern Washington. Dr. Donahue left the state employ several months ago to accept a position with The Carnation Stock Farm.

Milk prices between producers and distributors in Snohomish County will hereafter be fixed by a joint meeting of the board of directors of the Snohomish County Dairymen's Association and the distributors. This was decided upon in Everett at a special meeting attended by about one hundred and fifty members of the Snohomish Association, who agreed to accept the Seattle Milk Commission's prices with a ten cent per hundred weight differential below the Seattle quotation. The price for Snohomish County will include twenty-five cents per hundredweight for transportation expense to be charged to the shipper.

The Skagit Valley Cow Testing Association has been added to the western dairy division's list of those having 100 per cent pure-bred bulls. This makes six in the western territory. The Wahkiakum County Association also finished its year 100 per cent perfect. ALTON D. HURLEY.

"OK" Delaware County Puts Stamp of Approval on PINE TREE MILKER

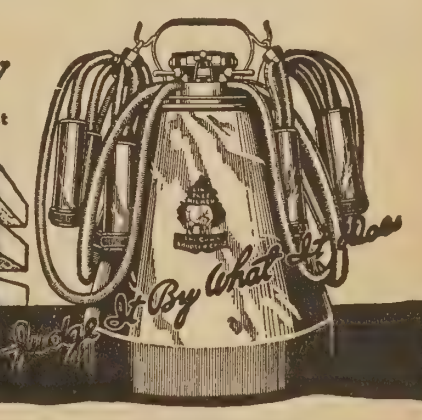
140 Farmers of Delaware County, milk with the Pine Tree. Every spot above shows an installation. Send for the key to this map, giving the names of every user — and letters from many of them.

THE map shows what the farmers of one of New York's greatest dairy counties, think of the Pine Tree Milker. Every spot shows an enthusiastic Pine Tree user. 140 of them, whose names are only omitted here through lack of space. Send for this list—the key to the map.

Delaware County, N. Y,, has its counterpart in every dairy state in the Union. Fond du Lac County, Wis.; Los Angeles County, Calif.; McHenry County, Ill.; Steele County, Minn. — all have shown the same unmistakable approval of the Pine Tree.

Farmers everywhere are thinking and talking milking machines. Men who still milk by hand find they are selling in competition with machine owners who produce their milk at lower cost. Even with easier labor conditions farmers are realizing more and more their need of a machine. You are going to buy a milker sometime. Better start *now* to learn why the Pine Tree has so completely dominated New York's greatest dairy county.

Learn something about pulsators! No chain is stronger than its weakest link—no milker is any better than its pulsator. When you look at a milker, look at the pulsator *first*. Ask any Pine Tree user, what kind of service he gets. He'll tell you his machine is on the job every milking, year after year. No fussing—no delays—*no expense*—and the Pine Tree Pulsator is largely responsible.



Send for the key to the map, get names of users and their letters. Send today sure!

Reduced Fare to Syracuse

Reduced fares to the biggest Holstein sale of the year have been granted by railroads in certain territories. Breeders coming to the Second National Co-operative Sale of the Holstein-Friesian Association of America, to be held from May 31 to June 4 in Syracuse, N. Y., in connection with the annual meeting of the association, will effect a 25 per cent saving.

States included in the reduced fare area are Michigan, Indiana, Ohio, Pennsylvania, West Virginia, Virginia, Maryland, Delaware, New Jersey, New York, and the portion of Illinois bounded on the West by a line drawn from Chicago to St. Louis. Breeders coming from beyond these states can secure reduced fares while within the area.

When buying tickets to Syracuse, breeders within the states listed should ask for reduced fare certificates. These will be stamped at the sale and count for one-half the cost of the return ticket.

Members from beyond the reduced fare section can secure a certificate when entering the territory and the reduction for that part of the trip. Officials of stations not having certificates will furnish information as to where they can be secured. It will necessitate a change in both cases, but will mean a saving.

Silos Are Essential to Dairy Progress

Every dairyman needs a permanent silo. Portland vitrified block and concrete stave silos are permanent. Also grain bins, coal pockets, supply tanks, cisterns, glazed building blocks and ensilage cutters. Farmer Agents wanted. Write today.

PORTLAND SILO COMPANY, Portland, Indiana.

When writing advertisers please mention Hoard's Dairyman.

EDITORIAL COMMENT

THERE is no substitute for milk, and its use should be distinctly increased instead of diminished, regardless of cost.—DR. E. V. MCCOLLUM.

WHY SO CARELESS

A man who advertises for help and then receives letters containing applications and references but who fails to answer the letters or return the references to the owners, shows not only poor business practices but poor breeding. It is unfair and unjust for an advertiser to hold letters of recommendation when he has been requested to return them and especially so when stamped envelopes are sent for their return.

One of our subscribers, who answered an advertisement for help, writes us, in part, as follows: "Why do these so-called high class breeders act so careless? Don't they think that the references are of any use to the person sending them? They are certainly of no use to any other person except their owner. At the present time, I have three references out by answering advertisements of breeders and I find it impossible to get them to return them to me or even answer my letters when stamps are enclosed for returning them."

It amounts to nothing more than downright discourteous treatment for any one to keep letters of recommendation even if the owner did not ask that they be returned. It is difficult to understand the reasoning powers and the business judgment of such men. They should not only make a pledge themselves to return all letters of recommendation but to answer each inquiry courteously. Such practice assists in building a business. It has a financial value. It is just common decency.

LARGER RETURN FOR BUTTER

In order to render justice to the farmer who produces a high grade of cream, it is necessary to establish grades and pay for cream according to its grade. It is unfair to pay as much for poor cream as for good cream, and such practice encourages the production of poor cream, for it is easier to be slack and indifferent than it is to follow right practices necessary for the production of a high quality of cream.

Minnesota College of Agriculture has issued a statement in favor of grading cream and points out the losses incurred when cream is not graded. It is, of course, impossible to state just how much is lost by not grading. This can never be determined accurately for there are so many factors that have to do with fixing the price of our various grades of butter. However, there is no argument for the production of poor butter. It is positively injurious to the creamery and to the dairy industry. Not only does it bring a lower price on the market, but less of it is consumed. A person will instinctively consume more of a high quality butter than he will of a poorer grade.

According to the quotations of butter in New York for the calendar year 1920, as shown by the United States Bureau of Markets, the average yearly price for butter scoring 93 was 62.39 cents per pound; for 90 scoring butter, 58.16 cents per pound; and for 86 scoring butter, 50.79 cents per pound. Between these scores the price varied according to the score. It will be observed that there is a difference of 11.5 cents between butter scoring 86 and butter scoring 93.

We are looking for opportunity to improve our system of marketing to bring to the producer a larger portion of the consumer's dollar. There is no system of marketing, no reorganization, nor anything else that will begin to bring the saving—or perhaps better say the return—to the farmer that is possible by the production of good cream, provided, of course, the creamery will pay for it according to its quality. There is an opportunity to return the farmer 11.5 cents more for his butter than is received for 86 scoring butter. The dairy experts of Minnesota hold that millions of dollars are being lost every year by the butter producers of that state through the lack of an adequate cream grading system; they estimate the loss to be nine million dollars annually. It is undoubtedly more than this because larger quantities of butter would be consumed if it were all of better quality.

A. J. McGuire, dairy specialist, holds that the Minnesota co-operatve creameries could, without difficulty, make a grade of butter that would score at least 92 points, if they would set about it in the right way, for already a third of their co-operative creameries are making butter scoring 92 and over. Creameries working for a better return for their butter may well consider seriously paying for cream according to grade. They, together with their patrons, control the quality and cannot lay the blame of poor quality of butter on someone else. It is within their power—those producing 86 scoring butter—to improve it and in this way stop one of the largest losses sustained by the butter industry.

LABOR AND INDUSTRY

That the increase in wages of labor has brought flagrant indifference and inefficiency in the discharge of its duties has been a source of disappointment to us. It is our desire to have labor well paid and when well paid we desire to have labor render a good service. We cannot understand the reasoning powers of men when they ask for shorter hours and increased pay and then expect to do less work per hour. There is no way of building homes, railroads, or anything else without labor. Money will not do it, neither will organization. There is only one way to develop the industries of this nation and that is through work.

The New York Herald, in an editorial, points out how inefficient labor has become and it indicates what results we may expect in all industries unless labor changes its practices. We quote:

"Twenty-odd years ago, according to records, a mason and his helper laid 1,500 bricks in a working day of eight hours for $5.25. To lay those same 1,500 bricks today costs, for the same labor, $40.80. But while this makes it cost the builder eight times as much in round numbers to get that work done now as it cost then, the mason and his helper do not earn eight times as much money at their trade. The reason is simple enough. What it took the mason and his helper only eight hours to do twenty odd years ago it now takes a mason and his helper half a week to do. In other words, the bricklaying capacity of a mason and his helper has fallen from 1,500 bricks a day to 500 bricks a day.

"At eight times the former rate a thousand bricks, the mason and his helper today get two and a half times the former wage a week because they do only a third as much work. But while the mason and his helper get only two and a half times as much as before, the cost to the man who pays the bills has to be, of course, that terrific figure of eight times as much.

"And here is what all that means to the man that rents the house in which laying the bricks cost eight times as much as before. There is not merely eight times as much interest on the cost of laying the bricks which must go into the rent; there is eight times as much taxes on the cost of laying the bricks; there is eight times as much depreciation; there is eight times as much insurance on the cost of laying them. The rent has to take in all of it.

"Nobody in this country ever suffered when workers time after time demanded and got more and more pay for doing more and better work. Everybody, in truth, was the gainer. But when workers produce less and less they are digging the industrial graves of both themselves and their country."

The farmer has not been guilty of any such inefficiency or indifference to his duties and it is unfortunate for all and particularly the laborers that they have produced this condition. They will pay very largely the penalty although all other classes will have to share it with them. We will never get back to the proper relationship until labor is willing to do a full day's work and for a compensation in keeping with what it earns.

IS CO-OPERATION SOCIALISM?

Some hold that co-operative enterprises are socialistic. We wonder just how sincere these objectors to co-operation are. Co-operation is the pooling of the interests of several individuals engaged in the same character of work. This is done for the advantage that comes through united effort as against individual effort. Co-operation does not destroy individual initiative or lessen the desire to be efficient.

Co-operative creameries were established among farmers because it is more work to make butter on the farm than to have it made in a factory. A more uniform quality of butter can be made upon a large scale and better markets can be obtained. There is nothing socialistic about fifty or more farmers building a creamery and taking their product there to be manufactured into butter. Each patron has a deep interest in the quality of the butter, in the best price to be obtained, and in the efficiency of the work done at the creamery.

No one owns a part of the co-operative creamery except those providing it with raw material. Socialism would make every individual in the community a part owner of the creamery even though they had no interest in it. If a co-operative creamery makes a profit, it belongs to the patrons who own it and to those who furnish the product for manufacturing butter. If it loses, it is the patron's loss and not the community's loss. No public funds are used for building the creamery; no arbitrary power is exercised to force the patrons or individuals of the community to act together, but the whole enterprise is carried on upon the volition of the patrons. These same farmers may go a step farther and form a co-operative marketing company in order that their products may be carried under their direction to the wholesaler or distributor in the city. These men produce the product on the farm; take it to the creamery where it is manufactured into butter and then provide means for carrying it to the market where the consumer may purchase it. It is nothing more or less than a business conducted by several people for their mutual benefit, and we can see nothing socialistic in this.

There is little difference between co-operation of this character and a co-operative enterprise where various individuals become stockholders in a manufacturing institution. These stockholders desire good results and efficiency; they want to excel that they may have a return on their money, and so it is with the patrons of the co-operative creamery. They desire this institution that they may manufacture their butter cheaper and be able to market it upon a better basis than if it were done individually. Their purpose is a larger return for their product. We believe the desire for gain earned through the giving of service is essential to the development of a nation.

One of the best presentations on the differences between co-operation and socialism was given by Mr. C. S. Barrett, president of the Farmers' National Union, in a communication to the consumers regarding some of the farmer's problems. He has pointed out the necessity of farmers co-operating for the purpose of marketing their products to better advantage and that consumers should likewise form co-operative enterprises that they may buy advantageously from the farmer. He then states: "Do not think I am advocating extreme, radical, or socialistic measures, for I am not. Agricultural and consumer co-operation are the antipodes of Marxian socialism or communism. The socialist lives under the enforced rule of the majority—by

law; the co-operator lives under the system of self-help through mutual help—by volition. Socialism may be despotism but co-operation is enlightened self-interest."

There is as wide a difference between socialism and co-operation as there is between our form of government and an autocracy.

Cheese Factory Equipment

We are trying to get farmers in our locality interested in dairying. Would you please advise as to capital needed to start a cheese factory to handle about 5,000 lbs. of milk daily? What machinery will be needed and what should be the cost of same?

What kind of cheese usually sells best?

Red Cloud, Neb. W. R.

The four principal kinds of cheese made in Wisconsin are American, Swiss, Brick, and Limburger.

American cheese is made in about three-fourths of the factories. Swiss cheese sells for the highest price, which is about 45c a pound at the factory, provided the cheese is of first quality. However, it usually happens that a considerable proportion of Swiss cheese made at any factory is second quality and sells for about 22c at the present time. With American cheese the present selling price is about 20c a pound. The usual yield of cheese is about 9½ lbs. from 100 lbs. of milk.

A cheesemaker is able to handle about 5,000 lbs. of milk daily and this will keep him fully occupied. The cost of supplies for making cheese, including salt, rennet extract, color, bandages, boxes, etc., will come to about 4c per pound of cheese, so that if the cheese sells for 20c a pound, your farmers will receive about 16c a pound, or if you made 10 lbs. of cheese from 100 lbs. of milk, they would receive about $1.60 per 100 for the milk.

American cheese is the ordinary kind most commonly sold in stores, and as there are few factories in Nebraska, you should be able to sell your output without difficulty either to a cheese dealer in your nearest large city or to stores in the neighboring small towns.

To start a cheese factory, you will need to provide a building which must contain a make room and a curing room, and usually it also includes living rooms for the maker's family, which are very often located above the factory. This is most convenient because the maker is on the spot all of the time in case of burglars or a fire or any accident.

The entire factory should be protected from flies and other vermin. The curing room at least should be well protected from the heat of the sun, and is usually located on the north side of the factory and the windows should have wooden shutters so as to shut out the light and heat of the sun in the daytime. They can be opened more or less during the night when the air is cooler.

You should estimate as part of your expense the annual cost of interest and depreciation or the amount of rent paid for the building used as the cheese factory. In addition, you may estimate the equipment needed for a small factory about as follows:

You can get a 5,000-lb. cheese vat for about $250, and, if you want to start most economically, you might get a self-heated vat, which has a small stove in the bottom for heating the milk which makes it unnecessary to provide a steam boiler. However, large sized factories prefer to have a boiler and a steam engine for pumping the water, running the curd mill, and the boiler also permits easy heating of the milk, the steaming of cans and other equipment, and the pasteurization of milk for making starter. I would suggest that you start with a self heating vat which will cost between $250 and $300.

The cheese press will cost about half of this amount and you will need about 25 Daisy cheese hoops if you make Daisies. These hoops cost about $3.50 apiece.

A curd mill can be bought for $15 and a pair of curd knives for $12.

You will also need platform scales weighing from one-half pound up to about 400 lbs. and a weigh can for weighing the milk delivered at the factory each morning by the patrons. A Babcock test outfit and some tinware such as conductor spouts, pails, and dippers, etc., will bring the total cost of this small factory equipment to between $600 and $700.

If you have 5,000 lbs. of milk, you should certainly put in a whey separator and skim the fat out of the whey, as you are likely to recover about 12 lbs. of fat daily from the whey in the form of whey cream and as this whey cream is very good for making butter or ice cream, and the fat is worth about 50c a pound, you have a profit of about $6.00 a day, which will soon pay for the separator and afterwards pay a large part of the running expenses of the factory.

This whey cream can be churned once or twice a week into butter at the cheese factory and sold to the farmers who bring the milk if you have no other outlet for it.

In addition to this, you should make some plan as to the method of settling with your farmers for their milk from the proceeds obtained from the sale of cheese. It is customary in this state to fix a cheese price on Monday, ship the cheese on Tuesday, have it arrive at the buyer's warehouse on Wednesday or Thursday, and the factoryman receives a check in payment for this cheese by Saturday or not later than the following Monday, when the time comes to sell the next lot of cheese.

The cheese has to remain in the curing room at least three or four days in order to dry off on the surface well in order to ship. Thus, the payments for cheese are about two weeks behind the receipt of the milk at the factory. In order to allow the cheesemaker time for figuring payments after receiving the money, it is customary to pay for the milk of one calendar month not earlier than the 15th of the following month, and some factories pay on the 30th. In this way, you will never have any factory capital invested in cheese and the farmers will wait for their money until it is received from the buyer.

In starting a cheese factory, considerable effort must be given to securing a clean milk supply, and especially to cooling the night's milk on the farms promptly after it is drawn from the cow, and keeping it cool throughout the night by setting the cans of milk in a tank of cold well water. Unless this is done, the milk is apt to be off flavored and more or less sour, producing a poor quality of cheese, especially in warm weather, so that the full market price cannot be obtained for the cheese.

A great many other details of the cheese making process are fully described in the last revised edition of Decker's book, "Cheesemaking". This is used by all Wisconsin Dairy School students and costs $1.90.

Wis. College of Agriculture. J. L. SAMMIS.

Peanut Meal

Very recently I was talking with a neighbor of mine relative to the amount of milk his cows were giving. He tried out some peanut hulls, with possibly some peanut grains, which he purchased from a peanut establishment in this locality. He says that it increased the cows' flow of milk considerably. He is feeding one-half peanut meal with the same amount of white middlings. Tell me just what you think of the elements in the peanut hulls and grain, and if they might be injurious to a cow in the event this feed was used regularly.

Chevy Chase, Md. J. B. W.

We apprehend that the results from feeding meal containing a large percentage of peanut hulls is, perhaps, more apparent than real. The hulls themselves contain very little feeding value but if not in too great proportion, the peanut meal will be high in protein and will make a most excellent feed for supplementing home grown grains. We have heard of no ill effects from feeding this class of meal. The peanut hulls are over half fiber and are less valuable than common straw. When the meal is made from the unhulled nuts, it will contain about 20 per cent crude digestible protein and 23 per cent fibre, which would make it about one-third less valuable than linseed oil meal as a protein concentrate.

Persistency of Milk Flow

A reader of Hoard's Dairyman wishes information which will enable him to judge the persistency of his cows. The question is how rapidly will the milk production decline month by month assuming the cow is milked ten months and calves again at the end of twelve months.

The important relation of the manner of feeding should be emphasized first of all. Too often a cow said to lack persisteney in milking is really doing all she should. She can not be expected to manufacture milk without a sufficient amount of raw material in the form of feed. The heavy milking cow only too often is underfed when fresh because nature, to make sure the calf will not suffer, has arranged so the fresh cow will continue to give milk freely for some time even if there are deficiencies in the feed, making up the deficiency from her body.

The normal rate of decline in milk during the lactation period then can be observed only when the cow concerned has at all times sufficient feed to supply the nutrients for the milk she is producing. The figures given are compiled from the records of a group of high class cows. These animals had sufficient feed at all times, were milked twice daily and dried up after ten to eleven months preparatory to freshening again in about twelve months. With the cows of this class the highest milk yield comes as a rule between the tenth and the thirtieth day, more often about the end of the first month. The yield during the first month may be expressed by 100%. The yield during the second month should be practically the same, declining from that point as follows: 3rd month, 95%; 4th month, 90%; 5th month, 85%; 6th month, 80%; 7th month, 70%; 8th month, 60%; 9th month, 45%; 10th month, 20%. It will be noted that the decline is not regular, becoming more rapid near the end of the lactation period.

If the cow is bred to freshen again in eighteen months in place of twelve, the decline in milk yield will be gradual and almost regular throughout.

University of Minnesota. C. H. ECKLES.

Cabbage for Hogs

I would like to know the value of green cabbage for hog feed when I can buy good corn at $2 per 100 pounds.

Punta Gorda, Fla. C. G. B.

Cabbage is a feed not especially well suited to the needs of hogs. While an allowance of this succulent roughage would be of some feeding value, a feeder can not make up a large portion of the hog's ration from cabbage and receive good results. It is much better suited to the feeding of sheep or cattle—being quite valuable for that purpose. The hog's stomach is not fitted for making use of large amounts of roughage as is the stomach of the cow.

Some idea of the bulk of this feed is obtained from the fact that 100 lbs. contain only about 8.9 lbs. of dry matter. In each 100 lbs. there are only about 1.9 lbs. digestible protein, 5.6 lbs. carbohydrates, and .2 lb. fat. In 100 lbs. of corn meal there are 88.7 lbs. of dry matter, including 6.9 lbs. of digestible protein, 69 lbs. carbohydrates, and 3.5 lbs. fat. From these figures it may be seen that cabbage cannot be given a high valuation. Calculating strictly upon a chemical basis, it will be worth only about 25c per hundred pounds when corn is valued at $2 per bushel.

Ensiling Corn Stover in the Spring

Would like to hear of some one through the Dairyman who has had the experience with cutting up cornstalks in the spring and putting them into the silo. What sort of feed does it make and will it keep any length of time?

Sawyer, Wis. E. J. S.

Readers who have tried out this system of ensiling corn fodder or corn stover are especially solicited to reply. Was the corn stored in barn, stack, or field prior to ensiling? How and when was the corn ensiled? How much water was used? Was water applied in blower or by means of a hose and then sprayed over the cut material in the silo? Did the silage keep well? How soon was it fed out? Was the silage palatable? How did it compare with regular corn silage in amount fed and results?

Cannot Register Grades

Please send me a list of state institutions which have taken grade herds and developed into pure-breds.

Brookewood, Va. J. A. C.

In order for dairy cattle to be given registration in the herd books of any of the dairy breed associations in this country, they must be from registered sires and dams. It is therefore impossible to register grades or any animals which are descended from grades, which precludes any institution from developing grades into pure-breds. If our reader desires to raise pure-bred animals, it is necessary for him to start with stock which is already registered.

Wisconsin Assembly Passes Filled Milk Bill

By a vote of 72 to 16 the Wisconsin Assembly on May 5 passed the bill prohibiting the manufacture and sale of filled milk. A strenuous fight was made by the manufacturers of the imitation condensed milk and resort was had to every means of influencing the members of the Assembly, but their efforts were without avail against the good sense of the legislators and the support given the bill by farmers all over the state.

The fight now goes to the Senate and the result cannot be foretold with certainty, although friends of the bill believe that it will pass with a good margin. It is important that farmers, particularly, write their state senators at once expressing their approval of Assembly Bill 477A that prohibits the manufacture and sale of filled milk. The effort of the organizations back of the bill can be most effectively supplemented by this means and Wisconsin dairy farmers will have themselves to blame if the bill does not pass.

National Dairy Conference

Twenty-two states were represented at the dairy conference called by the American Farm Bureau Federation. Those representing the various producers' associations, co-operative marketing companies, the creamery and cheesery federations gave the delegates of the conference outlines of their organizations, why they were formed, their problems, and what they have and expect to accomplish. It was a very successful conference, and we believe substantial assistance will be given the dairy industry from the efforts of this occasion.

In opening the conference Chairman Coverdale said:

"The American Farm Bureau Federation has been called upon at various times to offer suggestions and plans for the formation of co-operative milk and other dairy products' marketing associations. We have also been called upon through our state organizations to assist in lining up unorganized territory in order to strengthen existing organizations. It is the desire of the American Farm Bureau Federation to render the greatest assistance to the existing Dairy Products' Marketing Associations and also to be of service to the unorganized territory."

C. H. Gustafson, director of the Co-operative Marketing Department of the American Farm Bureau Federation, portrayed the broad general principles of co-operation. "All producers," he said, "whether of milk, grain, live stock, cotton, tobacco, or fruit, are confronted with unsatisfactory conditions. The present system of marketing seems out of date so far as the producer is concerned. Too often local co-operatives become competitors rather than co-operators. The many thousands of co-operatives must be united under one system for the benefit of both the producer and consumer. When two or more decide to do the same thing at the same time for the same purpose, then we have co-operation."

Space forbids, at this time, to give a review of each subject discussed, but we shall publish in the near future liberal extracts from the addresses made by those who appeared on the program.

The resolutions epitomize the conclusions of the gathering and outline briefly some of the things which must be given attention by those engaged in the protection and development of the dairy industry. The res-

Is Mule-Hide Roofing Good Looking?

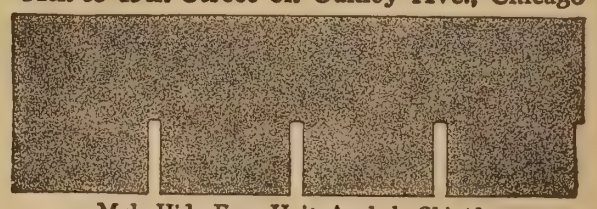
Yes, indeed, unusually so. MULE-HIDE is so good looking in fact that "It increases the selling value of the property it covers", as some users have put it.

—A Real, Permanent Protection?

It could not be otherwise, built as it is of only the best grades of asphalt and felt procurable; built to withstand heat, cold and storms, as any user will verify.

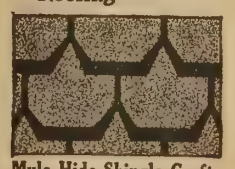
—Reasonable in Cost?

Tests and statistics show that MULE-HIDE invariably costs less per years of service,—the final clinching argument and the real reason for its unusual service record—



"Not a Kick in a Million Feet"

Unfading in beauty, unfailing in service—MULE-HIDE Roofing and Shingles are the logical and practical roofing protection for every requirement. Your dealer will gladly show you samples. Ask him.



MULE-HIDE Smooth Finish Roofing.

utions were unanimously adopted nd are, in part, as follows:

We recommend that the president f the American Farm Bureau Fedration be requested to appoint eleven ien, representative of the dairy industry of the United States to be seected with the advice and consent of ie National Milk Producers' Federaon. That as soon as possible, this ommittee shall convene and make uch reports and recommendations as heir findings shall warrant. The hief purpose of this committee will e to study the various dairy marketig organizations; to provide plans or marketing organizations in the unrganized territory; to strengthen ie present existing organizations herever possible; to recommend ians for the correlation of the varius dairy products co-operative marting activities in a national way, nd such other matters as the comittee may consider of value in the nterest of the producers and the consmers.

We recommend that the American arm Bureau Federation be requestd to appoint a dairy marketing spealist within the co-operative marting department for the purpose of o-operating with this committee and i the interest of the marketing of airy products generally.

The American Farm Bureau Fedration, in co-operation with state rm bureau federations and milk roducers' organizations, was reuested to undertake a producers' dvertising and publicity campaign esigned to increase the consumptive emand for dairy products.

The Capper—Volstead Bill, clarizing the Federal laws so as clearly i authorize the co-operative marketig of farm products, was endorsed.

Congress was asked to amend the Varehouse Act to include dairy prodcts and thereby permit better marting and financing.

A protest was filed against present eight rates on agricultural products ad the Senate investigation was ommended.

The manufacture of butter substittes out of vegetable oils was oppsed as injurious to the development ad health of present and future genrations.

In recent years, a compound made c condensed skimmilk and cocoanut d has been placed upon the market. he manufactureres of this product, ommonly known as filled milk, claim tat it provides a market for skimnik. This claim is not well taken, for istead of providing a market for simmilk it destroys a market for btterfat. In 1920, 7,000,000 lbs. of ocoanut oil were used in the manufcture of filled milk and as a result a market for 7,000,000 lbs. of buttrfat was destroyed and 8,000,000 lb. more butter was placed upon the rket. In other words, the cocoanut cw of the South Sea Islands repced 40,000 cows owned by Ameri-n dairymen, and the price paid for th skimmilk to make this compound ws not equal to what the live stock o the farm would return for it.

Moreover, this compound is sold as nik and when sold as such is a counterfeit. A fraud is perpetrated upon th consumer. It does not contain th nourishing properties of milk wich is the fundamental food of this ntion and no product has a right to sc imitate it that the consumer is liely to be deceived. The dairy indstry must be protected from this counterfeit and the consumer from deception. Legislation is urged to prvent the manufacture and sale of a compound of milk, skimmilk, and vegetble oils for human consumption.

An hourly wage was demanded for th farmer and his help that will compet with the hourly wage of equally skilled labor in other industries, and a tariff was urged giving the products of the farm protection equivalent to that accorded the products of the factory.

The appreciation of the milk producers of the country was voiced to the American Farm Bureau Federation for calling the conference and inaugurating a movement for the more extensive and intensive organization of dairy farmers in co-operative marketing associations.

Record Holstein in New Jersey

The senior three-year-old Holstein cow, Finderne Netherland Valdessa 374245, has set new 7- and 30-day records for the state of New Jersey. In 7 days this cow produced 16.88 lbs. of butterfat in 674.5 lbs. of milk; in 30 days she produced 66.87 lbs. of butterfat in 2,743 lbs. of milk. She exceeds the 30-day record of the former champion of the state by over 100 lbs. of milk. Her best day's production was 100 lbs. of milk, that being the 45th day of her test. She is owned by Finderne Stock Farms.

Put a Bottom in the Silo

HOARD'S DAIRYMAN:—I notice in your issue of March 25th, that L. P. B. wants to know why his silage molds. If he will finish up his silo by putting in a good, tight cement bottom—shaped like a saucer—I am very sure he won't have any more trouble with his silage spoiling. With nothing but the ground for a floor, all the juices leak away and, of course, it becomes too dry and will burn and mold. Better leave the roof off than the bottom out.

Bob Takes an Inventory

(Continued from page 702)

fered it to me this minute. Then there is this cow which didn't do well last summer and may never do well again. It has been a question for some time whether we ought to keep her. We'll call her worth $50."

Five two-year-olds about to freshen this spring carried some risk at the time of freshening, and at their age they were not yet ready to give their maximum flow of milk. Yet they were big, straight heifers and Bob estimated that they were worth $75 each. The bull, a yearling pure-bred with good ancestry, had cost $35 as a calf and had been fed and grown for over a year, so $75 seemed no more than he was worth, and he had probably cost that much up to date.

"There," said he, "that completes the list of cattle, 29 head in all. Now let's add them up and see what they come to." Mrs. Browning's neat, legible entries in the notebook showed this record:

Dairy Cattle	
15 mature cows at $120	$1,800
5 two-year-olds (to freshen soon) at $75	375
1 pure-bred bull	75
3 yearling heifers at $30	90
4 heifer calves at $15	60
1 veal calf	10
Total value of all dairy cattle	$2,410

Next the other outbuildings were visited, entries were made of two shoates, at $15 each, and 150 White Leghorn hens at $1.00 each. This completed the live stock.

"Now," said Mrs. Browning, "comes our hardest job. It is fairly easy to say what all these things are worth, but how are you going to value the machinery, tools, hay, silage, and grain?"

"Well," said Bob, "if we just keep our common sense working, take hold of one end and keep pulling, I guess we will unravel it into some sort of shape. Let's make our next heading 'Machinery', and under it we will inventory all harness, machinery, small tools, wagons, sleighs, and such things."

In placing a value on these the purchase price was considered, the number of years that the machine had been used, and the number of years it would last. The larger tools were soon listed.

When it came down to hoes, hand rakes, pitchforks, shovels, and all the other small tools, which the auction bills always describe as "other articles too numerous to mention", Bob and his wife decided to estimate the whole lot at $25 and made this as the last entry under the machinery heading.

The hay and feed was a more difficult matter and yet from the figures given in several reference books, and from the custom of selling hay by measure at the local auctions, it seemed fair to estimate the hay in the barn on the basis of 500 cubic feet being equal to one ton.

The mows were measured, the contents computed and a value placed on this at what it was worth at the barn. That is, the hay was valued at the market price minus the cost of baling and hauling it to market. In the same way the amount of silage was estimated and a value placed on it equal to one-third the value per ton of timothy hay.

The various bins in the granary were measured and the bushels of grain computed. The cow feed on hand was figured easily by simply counting the number of bags.

After all this had been done there still remained many miscellaneous items of seed and supplies such as one-half sack of clover seed, 40 bushels of seed potatoes, 2 bushels of seed corn, one ton of fertilizer, and 1½ tons of ground limestone. Each of these was entered up carefully in the account book and a value placed on it, becoming a part of the inventory under "Feed, Seed, and Supplies".

"Well," said Helen, "we have listed everything that we own, now suppose we list what we owe."

So under the heading "Accounts Payable", was listed:

Mortgage on farm	$3,000
Bank notes	250

The inventory seemed complete yet it had taken them only about four hours to do the entire job.

Bob and his partner were anxious to see what their figures could tell them, so after adding up all the various headings the inventory was summarized:

Inventory, Browning Farm, Feb. 4, 1920	
Farm 150 acres	$9,000
Horses, 4	725
Dairy cattle, 29 head	2,410
Poultry, 150 fowls	150
Hogs, 2	30
Machinery	875
Feed, seed, and supplies	840
Total assets	$14,030
Total accounts payable	3,250
Net worth	$10,780

"It has paid for the time, anyhow, just to see how much we are worth today," said Helen, after they had studied the figures a few minutes, "and I am thinking that after we do this next year and find out whether our 'Present Worth' has increased or decreased during the year, we will see that it has much more value than even now appears."

The inventory figures were filed away in a drawer of the desk. Spring soon came and Bob became so busy in preparing the ground and planting his crops that inventories were forgotten. Again the growing season rolled around, the harvest season came, the crops were gathered into the barn and once more came the long, cold winter with its short days, but each one packed full of business, as they can only be on a farm which runs a winter dairy.

During the spring and summer Bob had become interested in some pure-bred stock and finally purchased several head, paying partly cash and giving his note for the remainder. He had expected to pay for these out of his potato crop, but the season was bad for potatoes. Early in the spring the vines were struck with tip-burn to be followed immediately by blight and as a result the crop was poor. The price was not especially good and Bob felt that he had really lost money on the crop as a whole. Cabbage and canning factory peas, however, brought him a fairly good price, but the acreage of these crops was small and he had never depended on them.

The cows were doing well. The milk checks kept growing larger each month as more cows freshened and the pure-breds seemed to be justifying their cost in the milk which they produced, to say nothing of the offspring.

Yet Bob remembered his disappointment with his potatoes and as a result of the reaction from the hard summer's work with no vacations and few breathing spells he felt rather discouraged and wondered whether his year's work had not resulted in a real loss.

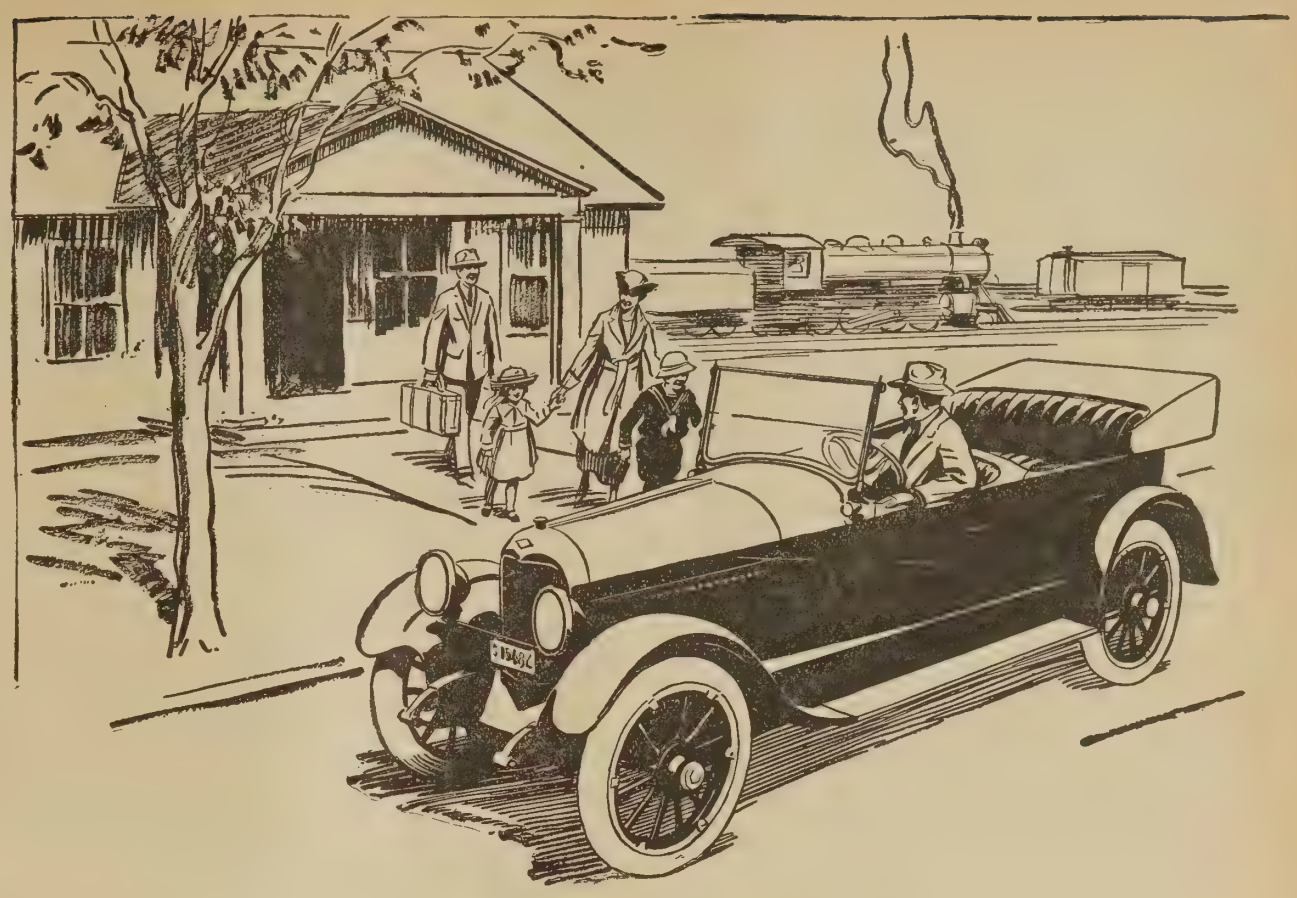
On February 4 the inventory book was brought out and the new inventory taken. This time it was easier. Most of the animals and articles had already been entered and it was a simple matter to check them up, to note the conditions and to place a value on them. Most of this inventory was completed at the desk in the

living room, with occasional visits to the barn, to get a better estimate as to the present value.

The farm was entered at the same value as the year before. The value of the horses was decreased a little in order to off-set the depreciation of the extra year's age. The hens and the hogs were not much different as Bob always calculated to keep about the same number of these on hand each winter. The cattle account had to be entirely changed. There was now a new classification, as there were five pure-breds in the herd. Each one of these had by right of birth and name a herd book number and, because of the performance of some of their ancestors, had a special value. The pure-breds were listed separately. The mature cows were placed in a class by themselves and the young stock classified as before except for two pure-bred calves that were given individual valuations.

All the machinery had been used for a year since the last inventory and an allowance of ten per cent depreciation was made. The hay mows, the grain bins, and the silos were again measured, the contents were computed and values again established.

The entire inventory required two hours. At the end of that time a summary was again made and these results were placed opposite the results of the previous year:



Inventory, Browning Farm. Feb. 4, 1921	
Farm, 150 acres	$9,000
Horses, 4	600
Dairy cattle, 32 head	3,315
Hogs	25
Hens	160
Machinery	900
Feed, seed, and supplies	1,080
Total assets	$15,080
Amounts owed (including notes for cattle)	3,800
Net worth today	$11,280

"Well," said Mrs. Browning, "last year we were worth $10,780, this year we are worth $11,280. That gives us a net gain for the year of $500. We haven't done so very badly after all, in spite of all these blue spells that you have had and your discouragement because the potato crop was poor."

Bob was surprised and mightily pleased. He had been feeling blue. The thought of that extra note which he owed and hadn't been able to pay as quickly as he had expected, had weighed on him all through the past few months.

"This inventory business pays," he said, "and I am going to turn over this page of the note book and write down three things I am sure of: (1) It is easy to take an inventory if you will use your best judgment and not fool yourself or cheat yourself on prices. (2) The later in the winter that you take the inventory, the less feed and supplies there will be to reckon on. (3) An inventory gives me more information for less trouble than any kind of an account that I can keep."

"But," added Bob, "there is one thing that keeps bothering me. I know now that the farm made a little money last year, but I am darned if I know where we made it. We had cows, hens, and pigs; sold potatoes and cabbages and peas and a little hay. We raised hay, oats, and grain to feed. Now which ones of these made money for us and which ones lost money and which ones made more money than others and which made less money than others? That is a question that our inventory won't answer, but it just simply makes me more curious to find out the whole truth." Next year we'll figure that out too.

PAIGE

The Most Beautiful Car in America

Three Factors of Quality

The great nation-wide success of the Paige New Series "Glenbrook" model is founded upon three attributes —Beauty, Performance and Economy.

When a man first looks at this car he is captured by the exquisite finish and long, graceful lines. He realizes that it is an unusual art creation—a newer and finer conception of the five passenger vehicle.

And then comes a trial on the road—one thrilling experience behind the motor that accelerates from five to twenty-five miles per hour in nine seconds flat. That ride is never forgotten and it leads inevitably to proud, enthusiastic adoption.

Later comes indisputable proof of low gasoline consumption, long life of tires and care-free, untroubled mileage. And last—but far from least—comes the confidence and respect that only fine products command. Such is the cause and effect of "Glenbrook" ownership.

Hand Milking Bars the Way to Good Profits at the New Prices

THE only way that you, like every other business man, can keep *profits up* is to keep *production expenses* down. Start right, by doing away with hand milking—by far one of the greatest wastes in milk production.

Owners of Sharples Milkers are making good money—are thinking less about market prices, and more about improved production—selling more milk and producing it for less money.

The Sharples is made in two types. The Sharples Master Milker (for large or small dairies) is now in satisfactory use on over one million cows and is to be found in nearly every country in the world. Our Moto Milker is an electric, portable milker made especially for six to twenty cow dairies that have electricity. No installation is necessary—simply wheel it in the barn and milk. It will run from a farm lighting plant. Both machines have the same gentle suckling action on the teats and the intermittent squeezing by Compressed Air (patented).

No other milker has a positive squeeze. No other milker even squeezes the teats out of round. No other milker uses compressed air. Sharples patents protect this absolutely.

Most cows give down more milk to the gentle, comfortable Sharples suckling action than they do to hand milking. They like it and it increases the mild yield.

A Sharples will cut your milking costs and increase your profits from the start. Let us send you our descriptive booklet. Sent free.

SHARPLES MILKERS

Settle the Harvesting Question Once for All

THERE are unusual advantages in settling the harvesting problem once for all this year.

There are two things to accomplish if you make a profit in 1921. You must farm economically and you must farm well—that is, get the biggest possible crops from your land at lowest cost.

An E-B Osborne Harvester bought now will help. You can be sure of your harvesting being done right, without loss or waste, not only this year but for many years to come.

Into the E-B Osborne Binder has gone the benefit of 60 years experience. Thousands and thousands are in active use. Their light running, perfect tying and long lasting qualities are known throughout the world. See one on your E-B dealer's floor or write for catalog.

DAIRY MARKET NEWS

New York Butter Market

New York City, May 3:—There has been a strong bearish sentiment in the market for some time. That is undoubtedly the result of a feeling on part of operators that readjustment is the order of the day in all lines of business and that prices must be forced down if they do not fail naturally. The nervous and sensitive feeling that has prevailed for several weeks still continues and probably will until values reach such a level that operators and speculators feel that it is safe to place stocks in storage. Undoubtedly, a stabilized condition will not obtain for fully a month as the flush of production will not be until about the first of June, even though the present season is far in advance for this time of the year.

Receipts continue to be moderate in spite of reports from producing areas that production is fully 25% greater than it was a year ago. It is apparent that there is a greater consumption of butter universally which is responsible to a great degree for the comparative smallness of shipments that are being received in this and other markets. It is doubtless true that many receivers who formerly shipped to this market have diverted their shipments elsewhere of late because of the effect on this market of the large shipments of Danish butter that were received here earlier in the year. It is thought that much of that butter will again be destined for this market in view of the fact that New York quotations are much higher than those of Chicago and fully as high as those of any of the other large markets.

Reports from Denmark state that practically all of the butter produced in that country is now finding a market in England, Norway, and Sweden and at prices considerably higher than could be obtained in this country. Danish butter is being offered for future delivery to this country at 39c, transportation and duty charges paid. It is readily apparent that with asking prices at those levels there is no incentive for local operators to speculate in the foreign butter. No California butter is forthcoming, hence this city must depend on its middle western sources of supply for its butter.

On Tuesday of last week, extras were quoted at 39½@40c. On the following day an unexpected weakness developed and prices declined 2c. On Thursday, the market continued to weaken and on Friday there was little activity. However, there was no change in quotations until Saturday when the price fell 2½c. On Monday, free buying caused a price advance of ½c and that was followed by a further recovery of 2c this morning. Quotations today are: Extras (92 score), 37½@38c; higher scoring than extras (93 score or higher), 38½@39c; firsts (90—91 score), 36@37c; firsts (88—89 score), 34@35½c; and seconds (83—87 score), 29@33c.

Heavy Declines in Butter Prices

[Report by U. S. Bureau of Markets.]

Receipts of butter on the four large markets for the week ending April 30 ran heavier than for the previous week, but the figures did not point to a very heavy increase in the "make" nor did it appear that such receipts would cause as much market surplus as there would be if trade were anywhere near normal. Trade is not normal, however, at this season of the year and shippers of butter, as well as receivers and buyers have all been waiting for such a break in prices as developed during the week.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending April 30, 1921, and the corresponding week a year ago were as follows:

	Week ending April 30 1921	1920
	Cents	Cents
New York	38.3	68.2
Chicago	35.0	63.9
Philadelphia	39.8	67.8
Boston	39.5	67.5
San Francisco	31.5	55.7

The receipts of butter at these markets were 10,217,766 lbs. as compared with 9,564,694 lbs. a year ago and 8,988,900 lbs. a week ago.

Cheese Trading Improves Slightly

[Report by U. S. Bureau of Markets.]

Stronger trading was in evidence on the cheese markets during the week ending April 30, but there was still an unsettled undertone which prevented really active trading. The general feeling the previous week was that prices were due for sharp declines. While a good many dealers still expect lower markets than have as yet developed, others now think that prices are close to bottom, or at least that another decline at Wisconsin primary markets such as occurred during the week under review will bring prices to about as low a point as will be reached this spring.

The average wholesale prices on American cheese (style Twins) for the week ending April 30, 1921, and for the corresponding week a year ago were as follows:

	Week ending April 30 1921	1920
	Cents	Cents
New York	27.5	29.5
Chicago	16.7	28.5
Boston	18.5	30.5
San Francisco	13.4	24.3
Wisconsin	15.7	28.3

The total receipts of American cheese at these markets were 4,050,160 lbs. as compared with 2,613,070 lbs. a year ago and 3,137,862 lbs. a week ago.

Straw:—Continued light receipts caused straw prices to remain firm but practically unchanged from last week. Prices are quoted as follows: Wheat straw: Philadelphia $17.50; Pittsburg $15; Baltimore $14; Cincinnati $12; Chicago $11; Omaha $8; Kansas City $8.50. Oat straw—Baltimore $15.50; Pittsburgh $15; Minneapolis $10; Chicago $12.50; Omaha $9.00 Rye Straw: New York $20.00; Philadelphia $19; Pittsburgh $15.50; Chicago $13.50; Baltimore $17; Minneapolis $10.

The Burrell Universal Teat-Cup

WHETHER of the same breed or of different breeds, different cows have teats of different sizes and shapes. In the development of an efficient and practical milking machine, this difference in the sizes and shapes of teats presented a difficult problem. It was the Burrell Universal Teat-Cup, finally perfected in 1910, which satisfactorily solved this problem. Time has proved it.

With the Burrell Universal Teat-Cup, only one size is required to milk the great majority of cows; and, although we make a large cup for extremely large teats and a small one for extremely small teats, there are many herds which have been milked continuously for the past ten years with only the regular size of the Burrell Universal Teat-Cup.

The feature of the Burrell Universal Teat-Cup, which makes this possible, is its ring-shaped air reservoir at the top of the cup. When the vacuum suck is applied, the air is pulled down and in rushing over the square shoulder of this reservoir creates an air-cushion which compresses and supports the teat in a natural and comfortable manner.

It will be significant to you that our study of milking machines extends back to 1860, and that during these sixty years we have experimented with every possible type of teat-cup. After exhaustive experiments, we developed the Burrell Universal Teat-Cup, adopted it because of its conspicuous advantages and discarded all other types as unsatisfactory. It is easy to keep clean and is inexpensive.

There are other exclusive Burrell features that you should know about — the Burrell Positive Relief Pulsator, the Burrell Automatic Controller, and the Burrell Moisture Trap. Get acquainted with the Burrell Milker.

Write today for our booklet and complete information. Tell us how many cows you milk and why you are not already milking by machine. Use the coupon below.

We Believe in Equity for the Farmer

IN tires, our idea of equity is to build a casing definitely for the rough, all-round use a farmer must give his car, at a price which makes rough driving cost less per mile.

We have done that in the Fisk Red-Top, and we are frank to say that no tire can give a higher average mileage under the severe test of a farmer's work-a-day driving.

It is made extra strong with an extra ply of fabric and a heavy tread. It is a tire which need not be coddled—one from which you may properly expect the excess mileage true of all Fisk Tires.

Our 140 branches enable your dealer always to have in stock fresh tires of this year's building—and every one has the stamina for a surplus of lively miles.

The Creamery Beautiful

(Continued from page 701)

the advertising mediums of this country, bringing before the people those wonderful facts. As it is, the dairymen have the long end of the argument, but they have indeed been slow in making use of it. Dairy products only too often are left to stand on their merits. The public is misinformed by unscrupulous advertising and it is up to the dairymen of the country now to re-educate the people to the great value of dairy foods.

By advertising dairy products dairymen not only serve their own interests but that of the country as well. In order to do more effective work the task of educating the people to the greater use of dairy products in their diet has been taken up by the National Dairy Council supported by state dairy councils. Organization of all the different branches of the dairy industry is under way in most states now and extensive advertising campaigns in co-operation with the National Dairy Council are being conducted.

Most of these campaigns are of a wide scope, including not only newspaper and magazine advertising, but also educational work conducted through schools, clubs, home demonstration agents, and numerous other agencies. Producers and manufacturers of dairy products alike certainly should recognize the importance of this work and give it their full support.

Attractiveness of the creamery grounds as well as that of butter in the packages is, however, one of the most valuable advertisements together with high quality products.

Beautifying Contests

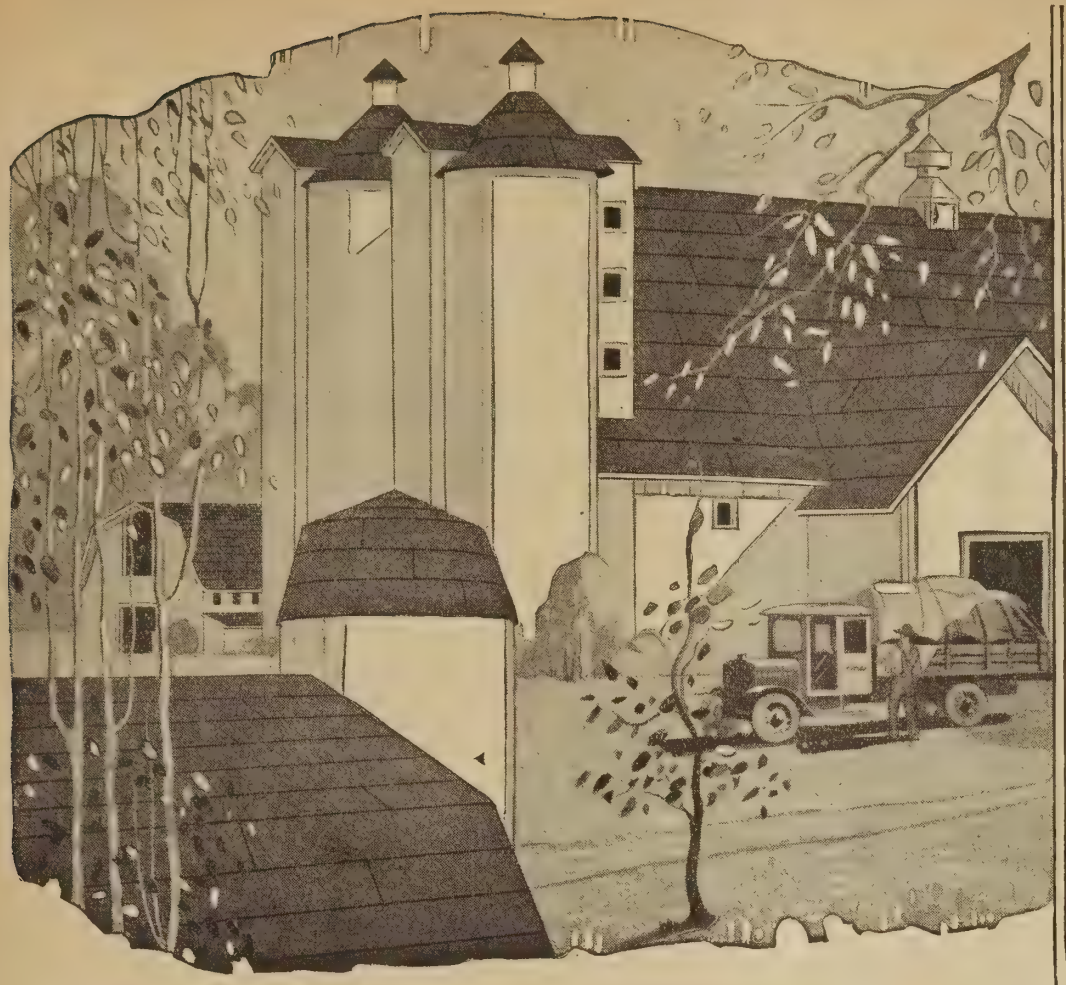
Many creameries, especially farmers' creameries, in the past paid little attention to this aspect of their business. Iowa, some years ago, made a move to beautify its creameries. For several years Professor M. Mortensen of the Iowa State College offered a cup to the creamery in Iowa doing the best work along the line of improving the attractiveness of its grounds. The cup was finally awarded to Guy Thomas of Clear Lake.

The beautifying contest in Iowa is now an annual affair. In 1918 it was won by H. C. Stendel of the Tenold Creamery near Northwood, in 1919 by L. Anderson, Coulter, and in 1920 by P. W. Petersen, New Hartford. The work done at these creameries is not at all extraordinary and expensive. Every creamery in every state should do something to beautify its grounds.

The contrast in appearance of the plants before and after beautification is wonderful in every case where an attempt was made. Should it not be the pride of every creamery in the country to form a respectable and attractive part of the local landscape of the community? A little paint, a shovel, and some elbow grease together with some well selected and arranged shrubbery will do wonders in many instances. A beautiful creamery is an advertisement of its products, an inspiration for its buttermaker and the patrons, a credit to the town, and a justification of modern dairying. Let's brush up. It pays.

COULTER CREAMERY, WINNER OF FIRST PRIZE IN 1919 IN CREAMERY GROUNDS IMPROVEMENT CONTEST

Profits by Selling High Test Milk



HOARD'S DAIRYMAN:—It may be of interest to you to know how we treat the problem of marketing our milk.

Suppose we drew from our cows 550 lbs. of 5% milk for one day and marketed the entire amount. We would then have for sale 27.5 lbs. of pure butterfat worth in milk, say, 50c pound, or $13.75. But we need 200 lbs. of skimmilk for our calves so we run through the separator 250 lbs. of our 5% milk, getting 12.5 lbs. of butterfat in 50 lbs. of 25% cream, leaving us the desired 200 lbs. of skimmilk. Now the question is, what will we do with this 50 lbs. of 25% cream to get the best returns?

In the cream the butterfat is worth but 40c per pound but in milk it is worth 50c per pound so we return the 50 lbs. of 25% cream to our 300 lbs. of whole milk still remaining from our day's run which gives us a mixture of 350 lbs. of whole milk testing approximately 7.8%. This puts a premium of 10c a pound on the 12.5 lbs. of butterfat in our cream, making it worth to us $1.25 more per day to sell milk of the higher test rather than to sell part cream and part milk. We also get the same price for our day's run of milk had we sold it as it came from the cows and we get 200 lbs. of skimmilk. This skimmilk costs us nothing, for the creamery would pay us nothing for it because they pay for the butterfat content of the milk and they have got all we had to sell in the 350-lb. mixture the same as they would had we sold them our complete day's run of 550 lbs.

Using the above figures you will note that our skim is worth about 62c per hundred whereas at the present price of top hogs it would not be worth over 50c with grain.

Haines, Oregon. D. H. P.

Are Your Roofs a Protection or a Menace?

The greatest danger of fire lies in its spreading from one building to another—particularly in the case of structures roofed with wooden shingles. If one building catches fire, sparks and burning embers falling upon nearby roofs may turn a small blaze into a serious fire.

Barrett Everlastic Roofings minimize this fire hazard. The popular low-priced, plain-surfaced form—Everlastic "Rubber" Roofing—is highly fire-resistant. Falling sparks or hot cinders may char it in spots, but they cannot set it on fire.

The beautiful red or green Everlastic Single Shingles, Multi-Shingles and Slate Surfaced Roll Roofing have the additional protection of a surface heavily coated with real crushed slate. And yet they cost less than ordinary, inflammable wooden shingles.

Fire-resistant, waterproof, easy-to-lay. Durable, economical, beautiful. What more can you ask of a roofing?

It will pay you to look for the Everlastic name when you buy.

THE BARRETT COMPANY, Limited: Montreal, Toronto, Winnipeg, Vancouver, St. John, N. B., Halifax, N. S.

Barrett Everlastic Roofings

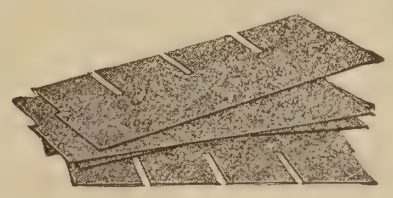
An attractive roof adds greatly to the appearance of the home

The Everlastic Line

Everlastic "Rubber" Roofing

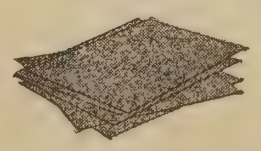
A recognized standard among "rubber" roofings. Famous for its durability. Made of high-grade waterproofing materials, it defies wind and weather and insures dry, comfortable buildings under all weather conditions. Nails and cement included.

Everlastic Slate-Surfaced Roofing



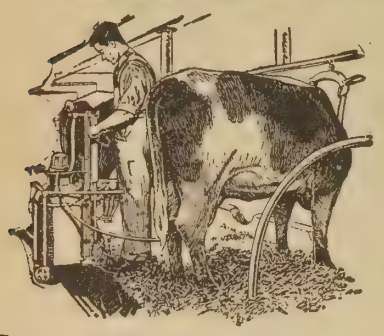
A high-grade roll roofing, *surfaced with genuine crushed slate,* in two natural shades, red or green. Needs no painting. Handsome enough for a home, economical enough for a barn or garage. Combines real protection against fire with beauty. Nails and cement with each roll.

Everlastic Multi-Shingles



(*Four-Shingles-in-One*)

Made of high-grade thoroughly waterproofed felt and *surfaced with crushed slate* in beautiful natural slate colors, either red



or green. Laid in strips of *four shingles in one* at far less cost in labor and time than for wooden shingles. Give you a roof of artistic beauty worthy of the finest buildings, and one that resists fire and weather. Need no painting.

Everlastic Single Shingles

Made of the same durable slate-surfaced (red or green) material as the Multi-Shingles, but cut into individual shingles, 8 x 12¾ inches. Laid like wooden shingles but cost less per year of service. Need no painting.

Complete MILKER *only* $123!!

Tremendous sensational milking machine offer. Every man who keeps cows—Read this!

Not one cent installation expense. No more complicated machinery, so simple a little boy can run it—fewer parts—costs less—*so amazingly easy* to clean—adaptable to each cow according to her character. Scientific, sanitary, practical; and *stays* in good order.

Hand Power—also
Gas Engine Power—
Electric Power.

Introductory offer:—

30 Days FREE TRIAL!

In every locality in which we have no dealer, agent or salesmanager, we will send *one* machine on 30 days' free trial and at our rock bottom price, direct from the factory; to the first responsible farmer who asks for it. No deposit; no C. O. D.; 30 days full free trial; you alone to decide. *ACT QUICK!*

After trial, if satisfactory, keep the machine on our IRON CLAD Guarantee.

Those who take the trouble to learn the knack are wonderfully well satisfied. Read this:

"We are more than pleased with the milker; it is a dandy; the cows rather there was no such thing as hand milking—but it takes thirty days for some of them to find it out. I couldn't send the machine back if I wanted to, as my men would both quit."
L. F. MURPHY, Hartford, Wis.

And hundreds of letters like this.

Wisconsin Holstein Meeting

The biggest meeting of Holstein breeders ever held in Wisconsin and one of the most important conventions to go to Milwaukee is the advanced word concerning the annual convention, meeting, and sale of the Holstein-Friesian Breeders' Association of Wisconsin scheduled for Milwaukee May 16th and 17th. The Republican House will be headquarters and the convention will open at 10 a. m. and close with a banquet at 7 o'clock in the evening. Eight fifteen should find everyone ready to go to a theater or other form of amusement as there will be no speaking in connection with the banquet.

The annual breeders' state sale will be held on the State Fair Grounds at West Allis on May 17th. Selling should commence at 10:30 in the morning. Lunch is provided on the grounds. Sixty cows and seven bulls specially selected by the sales committee from thirty-two of Wisconsin's best herds make up the consignment. L. L. OLDHAM, Sec.

The Wisconsin Breeders'

Northern State Sale

Marshfield, May 26

The Northern State Sale is under the auspices and management of the Holstein-Friesian Breeders' Association of Wisconsin. It is the outgrowth of a desire to populate the vast Dairy Empire in the Northern part of our state with a number of the very best foundation animals that we can possibly get together for dispersal. They will prove of much benefit to the breed and to the men buying them. They are the kind that only a State Association Sales Committee can get together. Breeders can ill afford to spare them but State pride is a big lever and we used it to pry them loose. The usual health and breeding guarantees at state sales prevail.

SIXTY COWS AND HEIFERS OVER SIX MONTHS ALL GOOD BUT SOME VERY CHOICE AS YOU MAY KNOW. A splendid 25-lb. daughter of King Johanna Korndyke Segis. A show cow and bred to Pabst Piebe De Kol King. A fine daughter of Pabst Pontiac De Kol King out of a 24-lb. dam. A 29.99-lb. 5-year-old cow that milked nearly an average of 100 lbs. a day on test. A 25-lb. daughter of Sir Fobes Ormsby Pietertje. A number of very fine daughters of Sir Bess Pietertje Fobes. A 24-lb. daughter of Canary Pearl of the Dairy. Another of the 100-lb.-a-day kind. A beautiful daughter of Pontiac Hengerveld Sir Korndyke. A cow claimed by many to be the finest show cow in the North of Wisconsin. A very attractive granddaughter of Queen Juliana Dirkje. She is now on test and making over 800 lbs. for the year. A splendid daughter of Homestead Junior De Kol. A daughter of Sir Ormsby Beauty Pontiac Segis who is the grandson of Pietertje Maid Ormsby and out of the highest living daughter of Count. Three very sweet daughters of Roberts Pontiac De Fries.

THE SALE SENSATION is a 30-lb. granddaughter of Old Sir Piet. She was wanted for the National at St. Paul but the owner was not sufficiently passive until too late.

NINE BULLS ALL OF SERVICEABLE AGE AND RIGHT GOOD INDIVIDUALS. A two-year-old out of a 29.99-lb. dam with 690 lbs. of milk in 7 days. A yearling son of Sir Ormsby Banostine Champion—the only son of Duchess Skylark Ormsby. His dam made 700 lbs. in the 10 months division at 9 years of age. His 2 nearest dams average 1,075. A son of Sir Bess Pietertje Fobes carrying 75% the same breeding as Bess Burke Ormsby the 42-lb. cow. A 3-year-old 30-lb. proven sire of good type and a quick sure breeder. He weighs 1,800 lbs. A 3-year-old son of Aristocrat Pontiac. The dam has 27.40 lbs. of butter and 625 lbs. of milk in 7 days and 1,150 and 25,456 lbs. in year. A show ring winning son of Senator Johanna White. The two nearest dams average 26.30 lbs. in 7 days and 19,748 lbs. of milk and 900 lbs. of butter in the year. A very choice yearling who is out of the same dam as the 36-lb. daughter of 37th and is sired by a half brother—thus carrying 75% the same blood. A fine young son of a 40-lb. two-year-old. The dam's sister has nearly 700 lbs. of butter and 18,000 lbs. of milk as a two-year-old.

You know something of the offering from the above. Space will not permit a description of it all. You won't be disappointed when you come to Marshfield and look the lot over the day of the sale.

The Sales are under the auspices and management of the State Association.
The details relating to the sale will be given by L. L. Oldham, Secretary.

Wisconsin Holstein-Friesian Breeders' Ass'n

241 Washington Building, Madison, Wisconsin

Don't forget Milwaukee May 17. The 4th Annual Wisconsin Breeders' State Sale will be held on the State Fair grounds. Attend the State Association Annual meeting at the Republican House the 16th. You will have a good time and renew many old acquaintances.

Kill Every Rat on Your Place

In Less Than ONE WEEK

Science Dooms Rats, Mice, Gophers

SCIENCE has doomed the pests which costs the farmer over $200,000,000 a year in the destruction of grain, poultry and buildings. You farmers need no longer suffer this loss, because I absolutely guarantee to kill off all the rats on your place within less than ONE WEEK'S time. This is possible through the remarkable discovery of the chemists of the Alexander Laboratories, Kansas City, Mo. They have perfected a virus that kills rats, mice and gophers as if by magic. Thousands are now using this wonderful Alexander Rat-Killer Virus and saving the money that rats cost them every year.

Read These Letters of
Absolute Proof

Rats Gone—Poultry Saved.

"Your Rat-Killer has certainly killed off the rats around here. We have always lost considerable poultry from rats and now are unable to see either rats or mice. I intend to recommend Alexander Rat-Killer to my neighbors." E. J. RENICK, Leeds, Mo.

Entirely Free From Rats.

"I have given your Alexander Rat-Killer a thorough test and believe it is the most wonderful thing I ever saw for ridding a place of rats. Our barns are entirely free from rats and mice and I want you to send three more test-tubes to use against the gophers here."
MOORE FARMS, Harry Moore, Owner, Gardener, Kan.

Rids Farm of Pests.

"Alexander Rat-Killer has killed all the rats and mice on our place and we are glad to recommend it."
WILLIAM AUSTIN, Rochester, N. Y.

No More Rats and Mice.

"Please rush me six tubes of Alexander Rat-Killer. I have tried out one tube in the barn and notice that there are no more rats and mice there. I am going to put it all over the farm now." ARTHUR C. ELLIOT, Montclair, N. J.

Home Free From Rats and Mice.

"I have conducted what I consider a strict test of your Alexander Rat-Killer Virus and find that my house is entirely free from rats and mice."
MRS. T. W. REED, Kansas City, Kan.

Not a Poison

Alexander Rat-Killer Virus is not a poison—it can be eaten by human beings or any animal on the farm as safely as their regular food, but it is quick sure death to rats, mice and gophers. Chickens, hogs, cattle or any other farm animal are not affected in the least.

Guaranteed To Kill All Rats Within ONE WEEK

Alexander Rat-Killer Virus is merely mixed with bread or meat scraps and placed where rats, mice or gophers can get to it. Within a few hours after a rat has eaten this virus he gets a high fever and suffers a terrible suffocation and thirst. He leaves the barns and nesting holes and goes to the open fields to die. Rats and mice thus affected always die far away from the barns or houses, so there is no odor. **In Less Than One Week's Time not a single one of these pests is left alive on your place.** It is a scientific fact that one rat affects others and soon the whole colony leaves the houses and buildings to die. I guarantee that though Alexander Rat-Killer Virus is absolutely deadly to rats, mice and gophers—chickens, hogs or any other farm animal can eat it and not be affected at all.

Big Introductory Offer

To introduce Alexander Rat-Killer Virus to one million new users and to rid America of rats as soon as possible, I will send a regular $2.00 tube of virus for only $1.00. Try it according to the simple directions, and if at the end of a week's time you are able to discover any rats, mice or gophers on your farm, your money will be refunded. A big Kansas City Bank says that I am reliable and will do as I agree.

Send No Money

Just write me—a postcard will do—and the regular $2.00 size tube will be mailed immediately. When it arrives, pay postman only $1.00 and a few cents postage, on my absolute guarantee that if not absolutely satisfactory your money will be refunded without question. You are the sole judge.

WRITE TODAY Don't lose money any longer from rats, mice and gophers. Write me today and rid your farm of these dangerous and expensive pests within a week's time.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Junior Gardener

Some juniors have complained to us that there is nothing for them to do that they can really call their own. Of course, what they really meant is that they cannot have a calf or a pig to raise. While it should be the ambition of every junior to learn all that he can about the best breeds of farm stock and how to raise them, still we believe that no junior should be idle waiting for the time to come when he can have calves and pigs of his own. They will come in the due course of time and, while we are waiting, we should not forget that there are many other things that all juniors can have a hand in.

We are going to propose vegetable gardening either on a small scale or a large scale, as a problem in which most any junior will be able to take part. It is a splendid thing to have a garden all of your own, even if it is but a part of the regular family garden. What we want you to do is to have one of your own, one that you alone are entirely responsible for. Even many of our city cousins can enter into this project and we happen to know that thousands of them have, all over the United States. A piece of land for a garden is something that almost any boy or girl is able to get. It is all right to work in mother's garden and of course we always want the juniors to do their share of the work in the family garden, but it is lots more fun in growing things that you can call your own. Maybe you can raise some things to sell and thus make a little money in that way. And when the season of fairs is on hand again, you will have some things to exhibit. Every farm home should have vegetables of all kinds for the table and maybe you can be the means of providing them.

Gardening is not difficult work, either. Some people have tried it and failed, and the biggest reason being that they did not look after it at the right time. Gardening, like everything else we do, will not be successful unless we take care of it. Planting is one thing and keeping the weeds out is quite another.

How to Plan a Garden Wisely

If we had only one rule to offer for junior gardeners to follow, it would be this. Make every part of your garden produce all that it is capable of. And it is not a difficult matter to do this, either, because we usually grow such a diversity of crops in a garden, some that require early spring planting while others demand the hotter weather of middle summer. To illustrate, tomatoes and turnips can follow lettuce and radishes very nicely. In this way no part of the garden will be idle for any great length of time.

Gardeners of experience always make a plan on paper before they start to plant. By doing this they can plan for everything to much better advantage. By knowing the size of the garden, a plan can be worked out on paper according to an adopted scale which will be found very useful all through the summer for you to refer to. Besides, it is good practice to do this and one learns to be economical and systematic. The plan you make should contain or show things like the following. The amounts of each vegetable and the space which you expect each to occupy, where each is to be located, the distances between the rows, dates of planting each, and whether or not more than one crop is to be grown on the same space during the season.

Of course, the size of the garden will largely determine the kinds and amounts of the crops to be grown. But, everything considered, if we are gardening to have vegetables for the family use in winter, we should give considerable attention to those kinds which can easily be stored and kept for winter use, because when the winter months set in, we all appreciate having vegetables for the dinner table and there is little reason why plenty should not be found stored in every farm cellar. If we all only realized how valuable vegetables are in keeping us in good health, we would find cellars much more complete with a good winter's supply than we usually do.

Too many people realize too few facts about the best ways to plan the garden. We want you, juniors, to take a pride in doing the best job that you can. It is much better practice when you have but a small garden to plan on planting the lettuce and radishes between the rows of those vegetables that will occupy the land all summer and into the early fall. If we do this, we can plant lettuce and radishes between the rows of carrots and parsnips. This will be quite a saving of space. And if you do not have sufficient room for large plants like corn, do not attempt to grow them in a small vegetable garden. Other vegetables that will give a better account of themselves and that will use the space to better advantage should be selected.

And, of course, it is good policy to grow as large a variety as is practical, but on the other hand one should not select those about which he knows little. Some garden crops are hard to grow so it would be better to let them alone and confine your efforts to those that are easier to handle. If there are any places in the garden spot that are inclined to be more shaded than others, plants like lettuce and spinach should be planted in these. Although such plants must have the sunlight, they can get along better than can some others with a less amount. And another fundamental rule should be to train big spreading plants like tomato vines up on stakes so that they will not take up so much of the space. In addition, they will bear a better quality of fruit. In planning for a large garden, one should plan to use as much horse power as is possible in cultivating. In the smaller gardens, we must expect that the weeding and hoeing will have to be done by hand.

THERE'S HEALTH, WEALTH, AND PROSPERITY IN A GOOD GARDEN

Getting the Soil Ready

It is not a good plan to be in too much of a hurry to plant the garden. Thorough seed bed preparation is what is necessary if you expect the plants to grow rapidly. This involves several considerations. Perhaps it means a good application of well rotted stable manure to increase the fertility of the soil. If it does, the manure may be applied either before the plowing or the spading is done or following, providing it is well worked into the soil. Most vegetables like plenty of lime in the soil. Perhaps it would not be out of place to work some of this into the soil. Commercial lime if allowed to slake will do the business and will make a soil, that is inclined to be sour, much sweeter.

And at no time should one work in the garden when the soil is too wet, and especially not at the time during the preparation of the seed bed. A soil that is either plowed or spaded when it is too wet will be very lumpy when it dries out and there will be trouble all summer in working it. This is especially true of those soils that we term "heavy" or those which have a high clay content. As a matter of fact, it is better to avoid this kind of a soil for gardens if something better can be had that is conveniently located. A rich, sandy loam is a good garden soil, but with proper attention most any soil will give good returns. The plowing or spading should be deep. Most vegetables want to send their roots deep and, in the case of root crops like carrots and turnips, unless the soil has been worked to a good depth, they will not grow to a good size and they are liable to be very irregular in shape. Then there is another important feature about garden plowing that should be recognized for the sake of making the following work in the garden easier. It should be so well done that all organic rubbish of all kinds will be turned under and completely buried where it will be out of the way when we plant and hoe. Some people who make small gardens spade only the amount that they will plant at any one time. It is much better practice to spade the entire garden when you once start, because later on the soil may become too dry to do a good job. Spading early in the spring helps to hold the moisture in the soil. And it is a good practice when once the spading has been completed to rake over the entire surface at once before it dries out too much. This will make a fine seed bed surface and you will find that it is much easier to plant the fine seeds when you get ready to do so. One cannot be too careful about getting the soil ready, for much of the success you will have is determined by how well the job is done. Because most of the garden is not planted immediately following the plowing or spading, each strip as it is planted should be separately prepared. A hand cultivator will do this very well and if one of these is not conveniently at hand, the hoe will do just as well. Then with a little careful raking an ideal seed bed can be prepared.

Certain Garden Tools are Necessary

If one wishes to work to advantage, certain garden tools are quite necessary. A good iron toothed rake is very essential to fine the surface with. This is indispensable and there is hardly any time during the planting season that it will not be used. Of course, a garden always suggests a hoe, and we think that the most convenient hoe to have is one of the three cornered kind. If the handle is attached at one corner, so much the better for making trenches to receive the seed, especially when a planting line is being used. A tape for measuring is also a good thing to have, although one can get along without this. A strong trowel will be found almost necessary at times, especially when working with such plants as are usually transplanted. There should be a good strong line to be used for guiding the planting of the rows and in addition there should be a couple of strong stakes to attach each end of the line.

One should always take good care of the tools and equipment each time after they are used. This will save some time and trouble and one should get in the habit of keeping them in a convenient place where they will always be found. The hoe, trowel, and rake should be kept clean and dry so that they will not get rusty. Dirt sticks readily to a rusty hoe and then it is almost impossible to use it. A little precaution will mean a great deal the next time you want to use it.

Planting the Seed

Good strong seed should be used, and a good soil and seed bed will avail but little unless the seed used is good. It is a good practice to germinate some of the seeds in a tester before planting them in the garden. This may be done most conveniently in one of two ways. By planting about fifty in a box of sand, one will soon know the kind of seed he has, or he may place the same number of seeds between two moist pieces of cloth or blotters held in a plate. In a few days this will tell the story. If from 75% to 100% of the seeds grow and produce strong, vigorous looking plants, the seed is good and may be used with safety.

And another matter that you juniors should not be too impatient about is too early plantings. Most seeds

germinate best when the soil is warm, and the weather is fairly well settled. When once out of the ground, they should grow rapidly if they are to be of good quality. This is especially true of those plants that require warm weather to make them grow the best.

The line should always be used to make straight rows. It should be stretched tight and kept close to the ground if you want to keep the rows as straight as possible. In order to get the line tight, the two stakes should be set firmly in the soil so that they will not give. If the row is quite long, another stake set in about the center will help to keep the line tight and in place. You must remember that the line is simply to act as a guide in keeping the rows straight and with this in mind, when the trenches for planting the seeds are made, it should not be crowded to one side.

For small seeds, a shallow trench is best and the right way to make it is to use the end of the hoe handle if the soil is loose and fine. It would be a difficult matter to state how deep the trench should be, but we might say this, that it should be just deep enough to allow the seeds to be covered well. In planting large seeds like peas, it should be deeper than for small seeds like onions. And if the soil is inclined to be lumpy it should be made some deeper.

If a deeper trench is desired, it can be made by standing close to the line and using one corner of the hoe. By moving it backward and forward, it can be kept straight, at least more so than by drawing it forward in a steady stroke. With the trenches made, the seed is ready to be sown.

It is entirely unnecessary to have a garden drill for the planting of small gardens. Planting by hand does a good job and it is not likely to take as much seed. An easy way to do this is to pour some of the seeds into the left hand and then by taking a pinch between the fore finger and thumb of the right hand, they can be distributed quite uniformly in the trench by rolling them out if the thumb is rolled across the finger. With a litle practice, one soon becomes quite expert. Another way to accomplish the same thing is to leave the seeds in the package and then holding it over the trench and shaking it gently, the seeds will drop out quite uniformly. Both require practice but either way is easy to learn. Of course, too many seeds will drop and consequently there will be too many plants in the row, but these can be thinned out later on.

Covering the seed properly is no small item in the success of the garden. There are two very fundamental things to look out for. One is to see that all the seeds are covered, and the other is to press the soil closely about the seeds, so that they will germinate better. In order to do this, some of the soil on either side of the trench should be worked back over the seeds and then pressed down, either with the back side of the hoe or by stepping upon it. Following this some loose dirt should be raked over the row to prevent too much escape of the soil moisture by creating a soil mulch over it. All of this is very important if you are to get the best results.

The row should then be marked. This can be done by placing a stake at either end. Then if one wishes to loosen the soil following a heavy rain which has compacted it too much and before the young plants are out of the ground, he can do so without disturbing the soil too deep over the row.

Why the Rows Should Be Thinned

No matter how carefully the seeding is done, there are bound to be too many plants in each row. This means that unless some are removed there will not be the proper development that one should expect. In general the best time to do the thinning is just after a rain and while the plants are still very small, for the reason that they are often most easily removed without disturbing those that are to remain. The average distance that there should be between the plants after they are thinned is anywhere from 6″ to 10″. However, in the case of certain vegetables like onions and beets, a partial thinning at first will enable the plants to get sufficient growth so that they may be used for the table from time to time.

Keeping the Garden Clean

Have you ever seen a garden that gave great promise in the beginning that was a failure in the end? If one sets out to have a good garden, he must expect that planting is but a small part of the operation that goes to make success. Keeping the garden clean is very important.

The vegetable plants cannot be expected to compete with the weeds for moisture and plant food, for the weeds usually grow faster and they soon crowd the young plants too much. And keeping the garden clean accomplishes other things. When the soil is kept stirred either with a hoe or a cultivator, the moisture cannot escape at the surface as readily through evaporation. And after a heavy rain when the soil dries out and tends to bake, forming a hard crust over the surface, cultivating it breaks up the crust and admits the air to the roots of the plants. All of this does more good than we are usually aware of, for our efforts are rewarded by the plants making a much better growth than they could if we did not cultivate. In a small garden, one does not need any tools other than a narrow rake and a small hoe. Smaller tools are much better for they enable one to work more closely about the plants and the job is usually done much better. If you are buying hoes and rakes this spring it will pay you to consider carefully before spending your money. Avoid large tools to work the garden with. In addition to the two tools mentioned, a hand cultivator will be found very convenient to have. In a soil that has been properly prepared, these implements do very good work and they cut down on the time required to do the work. No matter what tool is being used, the object should always be to stir the soil thoroughly, leaving the surface fine and smooth. One of the tests of you as a junior gardener will be, how clean did you keep your garden during the summer months. If you have done a good job, there will not be a single weed going to seed this fall in your garden patch.

Junior Letter

Hoard's Dairyman Juniors:—This is our first letter to the juniors. We have been reading the junior letters for some time and are very much interested in them, so we thought we would write one and see how it would compare with the rest of the junior letters.

We live on an 80-acre farm 4½ miles southwest of Fond du Lac. We have sixteen grade Holstein cows, three heifers, and one registered Holstein sire. We also have three horses, 26 Duroc pigs, and 70 chickens. Father started seeding about ten days ago and last Saturday we had the worst blizzard we had this winter. The snow was piled up three and four feet high in some places but in a day or two it will be all gone again.

My two brothers and I have three old Belgium hares, seven that are pretty near full grown and twelve that are about three weeks old. We feed them clover, soy beans, vegetables, ground feeds, corn, and skimmilk.

We have a milking machine and we boys do the milking all alone with the exception of starting the engine.

We wish the juniors would write to us, we would be very glad to answer their letters. Our address is R. 4, Fond du Lac, Wis.

Elmer, Victor, and Leo Kramer.

STOCK FOR SALE

Holstein heifer and bull calves. Pure-bred, registered and high grade. Splendid individuals and breedings. Delivered to you, $25 and up. Your inquiry will be given our best attention. BROWNCROFT FARMS, McGraw, N. Y. 5*

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wis. 12*

For Sale—At Elmwood Stock Farm, high grade Holstein cows, fresh and springers, by the carload. JOHN MURPHY, Mukwonago, Wis. 3*

"The Willows" offers fifty high grade Holstein cows for sale. S. D. SHAMBEAU, Waupaca, Wis. 12*

High Grade Holstein heifer calves, two to four weeks old, from tuberculin tested herds, $30 each, crated. Will ship C. O. D. WAUKESHA CO. HOLSTEIN-FRIESIAN BREEDERS' ASSOCIATION, Waukesha, Wis. 9*

High Grade Holstein and Guernsey calves. $25 crated. Safe delivery guaranteed. BROWN & COLLINS. Lima Center, Wis. 16*

Serviceable grandsons of Lola Segis Pontiac Homestead for sale, he a 34-lb., 1,000 lb. son of Piebe Laura Ollie Homestead King. Their dams are daughters of Joe Oak De Kol Fobes. Well grown, good individuals. Your choice, $150. R. W. MEAD, Stillwater, Minnesota. 10*

Holsteins—37-lb. herd sire, young bulls, cows, heifer calves. PHILIP LEHNER, Princeton, Wisconsin. 6*

Closing out herd of grade Holsteins, $100.00 each. H. A. KUHTZ, Waukesha, Wisconsin. 24*

For Sale—My entire herd of choice high grade Holsteins, mostly bred to and sired by thirty-pound bull. There is one full load of the best large heifers in southern Wisconsin, uniformly marked, about three-fourths white. C. L. SIMMONS, Belmont, Wis. 1*

Baby Bulls—Registered Holstein-Friesian by high class sires and heavy producing dams. Price is right. C. S. MULKS & SON, Whitewater, Wisconsin. 3-*

Listen! Your last chance to get some of those beautifully marked extra high grade Holstein heifer calves at greatly reduced prices. Registered bull calves $35.00 C. O. D. Look them over and if they don't suit don't pay for them. J. M. MCFARLAND, Watertown, Wisconsin. 14-4

Lake Shore Holsteins—Fifty fine, big, fat, pure-bred yearling heifers. One or all, priced to move them at once. Come. E. J. OPPLIGER, Forest Lake, Minn. 14-4

Holstein heifer calves, high grade and well marked, three to six weeks old for $16.00 crated. Registered bull calves $35.00 each. RUDOLPH KUNDERT, New Glarus, Wis. 14-*

30 Registered Holsteins—Entire herd, prime condition. Bargain. All or part. DR. HAINES, Three Rivers, Mich. 15-3

For Sale—Registered Holstein bull, 4 weeks old. Korndyke King Hengerveld strain. $50. JOS. T. RYAN, 1201 West Lake St., Chicago, Ill.

Nice registered Holstein bull. Eight months old, well marked, thrifty, high yearly production sire, $75. Younger bulls, $50. WARD BROTHERS, Fort Atkinson, Wisconsin.

Holstein Bull—Ready for service, 2 dams average 106 lbs. milk in one day, 40.67 lbs. butter in 7 days. $200 terms. Also two heifer calves. ROY HARRIMAN, Appleton, Wisconsin. 17-6

I have 4 or 5 cars of high grade Holstein cattle for sale. Address J. E. MCMAHON, North St. Paul, Minnesota. 17-2

Small herd Registered Holsteins wanted on shares on my farm. Experienced and equipped. G. E. NICHOLS, Murray, Iowa.

We ship our 7 weeks old Holstein calves subject to inspection c. o. d. for $28.00. Express charges paid. Special price on lots. SPREADING OAK FARM, Whitewater, Wis. 17-tf.

For Sale—My entire herd of pure-bred Holsteins, one cow and three heifers giving milk, one two-year-old heifer, two heifers, 11 and 16 months, sired by son of King Segis, one heifer calf 4 months, and herd bull 15 months. Price $1,025. WILLIAM PEITHMAN, Richview, Ill.

My entire herd of grade Guernseys for sale. Also a few choice heifer calves at $30.00 delivered. SHADY HILL FARM, Whitewater, Wis. 23*

Guernsey heifer calves. Can ship you 10 at once about 4 weeks old. Calves out of my own herd, so know what I am shipping. $30 each crated. F. O. B. Waukesha. WERN FARMS, Waukesha, Wis. 18*

For bargains on May Rose bulls with type and production, write KUHTZ BROS., Waukesha, Wis. 21*

I have a few choice improved and partly improved farms in the famous potato and dairy region of upper Michigan, 40 to 160 acres. Low prices and easy terms. JOHN MAJOR, P. O. Box 198, Marinette, Wisconsin. 16-13

We have three quarter-sections of land in Bottineau County, North Dakota and two quarters in Renville County, North Dakota. We are in the market to exchange a quarter or more of this land for some registered Holstein cows or heifers. We would want them to be of good quality, and we would price the land right. We have a 1,200-acre stock farm close to our place of business here in Illinois and could use these cattle to better advantage than we can the land in North Dakota. If you have anything to offer, kindly let us hear from you stating the age of your cattle, the number, the price, and whether or not they are tuberculin tested. BANTA BROS. & CO., Lowpoint, Illinois. 16-3

Register and secure a Farm—Our colonization plan offers the man who wants a farm a greater opportunity than a U. S. Homestead. Good man can register and get good land, and we furnish him 4-room house, barn, cows, and tools. To show good faith settler deposits $500 on buildings and stock—that's all. After 3 years, settler pays for farm at $100 a year. Over 100 registered, got farms and started last year. Many from Wisconsin. Good places on new road ready right now, so write for free books, maps and registration blank, or come at once to look. NATIONAL LAND COLONIZING CO., Box A15, Ladysmith, Wisconsin. 16-3

A good boy wanted on small dairy farm, age about 16 or 17 years. A right good place. Write J. C. WARD, Belmont, Wis.

Surplus Milk

In the following statement Mr. C. H. Staples gives a lucid outline of the surplus milk situation in Louisiana. He indicates very clearly the necessity for a uniform production throughout the year, and for providing means for handling milk other than through its sale for distribution in the city market.

Spring time as usual has brought an increase in milk production in Louisiana that confronts the milk producers as one of their most serious problems. The problem is serious, because no provision is made for the handling and disposition of the surplus milk at a profit by the producers.

The farmers depend almost entirely upon the milk dealer to buy the increase in production, which is impossible for the reason that the dealer cannot increase his sales to this extent. The amount of whole milk that can be handled by the milk dealers or the farmers who sell direct at retail to the consumers, must be based on the average monthly production for the year and on the amount of whole milk that the public demands.

If the producers in the whole milk sections expect and demand that their entire production must be sold by their respective dealers they must stabilize their production and produce a more equal amount at all seasons of the year. This can best be done by the dairy cows freshening in the fall of the year.

The milk producers can help their own situation greatly by using the cream separator when the production increases, feeding the skimmilk to calves and pigs and selling the cream to the creameries. Increase in production comes mostly with the freshening of dairy cows, which means that there are young calves to feed and they should have a large percentage of the increased production. No country can improve its dairy cattle without raising its best heifer calves and they must have milk if the best development is to be had.

With the continual growth of the dairy industry in Louisiana the demand for whole milk is going to be supplied. When this stage in production comes, the surplus must be disposed of by the producers in products other than whole milk. The creamery will no doubt prove to be our best market for the surplus and is found in all dairy sections. If every farmer would sell one-third of his production as cream and utilize the skimmilk on the farm, it would mean better dairy herds in the future, less trouble in marketing the products, and the realization of greater annual profits.

Until Louisiana dairymen, and especially in the whole milk sections, realize that they as individuals must do their part to help solve this present and serious problem of a surplus of spring milk, the dairy industry will not make much progress.

Three Champion Alabama Jerseys

Alabama has three new champion Jersey cows. Fairy Lad's Pallas 5th becomes champion in the junior two-year-old class with a production of 10,417 lbs. milk, 500 lbs. fat. She is owned by J. E. Dunaway. In the senior three-year-old class Eminent 25th's Foxy and Praytor's Miss Oxford, both owned by Praytor & Jemison, have been close contestants. The former was champion for 24 days with a record of 10,822 lbs. milk, 585 lbs. fat. Praytor's Miss Oxford completed her record 24 days later with a production of 10,553 lbs. milk, 606 lbs. fat.

Are you boosting boys' and girls' clubs for your neighborhood?

Add Six Extra Working Days To Every Month

THERE'S one big reason why you need a Universal Natural Milker in your dairy--***It saves you time.***

It will do your milking in one third the time it takes you now to milk by hand. This is a *fact* based on the experience of thousands of dairymen who use the Universal Milker.

Gentle suction--then soothing massage. That is the action of the calf sucking. It is exactly the action of the Universal Perfect Teat Cup.

Universal natural milker

Even though you milk but 15 cows--*the Universal will save you six extra working days every month -- more than 70 days a year.* And, in addition, you get a cleaner, better, more satisfactory job of milking. *Write for literature.*

In every instance it will be necessary to give a full description of the symptoms present.

Cowpox (Vaccina)

While this disease is comparatively common among dairy cows we frequently find other somewhat similar but simpler troubles mistaken for it and viewed with considerable alarm. The latter, however, are not contagious whereas true cowpox gradually spreads through the herd attacked. The infection also tends to remain in a stable and attacks are manifested by recurring crops of characteristic eruptions on the teats of the same cow.

The disease is acutely infectious and is caused by a virus which cannot be detected by microscope and so passes through a porcelain. It is therefore termed an "ultra-microscopic, filterable virus". The disease is communicable to man, the hands of the milker frequently becoming infected. When contracted in this way the person infected is thereby rendered immune to smallpox of man, and it was this fact that led Jenner in 1796 to institute the practice of vaccination of people with the virus of cowpox to protect them against smallpox. Outbreaks of the disease in cattle are traceable, ordinarily, to recently vaccinated persons, and it is alleged that it may possibly be communicated by milkers convalescing from smallpox. In our experience the disease is usually brought into a dairy stable by a new bought cow or by a new milker who has been handling affected cows.

The disease is ushered in by a slight, seldom noticed fever. Then the teats swell at their bases, become red, and show an eruption of nodules in two or three days. The udder may also redden and swell and occasionally shows round nodules. Those on the teats are oval in form. In from one to two days more vesicles or blisters form and are filled with clear liquid or lymph which contains the specific virus of the disease. The vesicles are reddish, bluish, or yellowish white with a metallic lustre and are surrounded by thickened, reddened tissues. They become concave or depressed 8 to 11 days after the onset of the attacks and the fluid, which has now become pus-like, is contained in several compartments. If ruptured, angry red sores result; otherwise the fluid dries and scabs or crusts remain. When the scabs drop off characteristic "pits" or "pock marks" are seen but soon disappear. The vesicles usually are few in number, and may occur in successive crops. The attack generally subsides in 30 to 40 days. Milk contaminated by liquids from the vesicles may transmit the disease. Teats may become so sore that milking tubes have to be used.

The disease must run its course. There is no specific remedy. The most important matter is instantly to isolate the affected animals and have them milked by someone who does not handle the other cows. The next important consideration is to prevent the affected parts from infection by filth. Infected sores often induce ruinous mammitis. Floors should be kept clean, disinfected, and well bedded. Vesicles should be painted daily with a saturated solution of permanganate of potash as soon as their liquids discharge. This quickly causes formation of crusts. Should any sore become aggravated by infection, strong iodin ointment applied once or twice daily generally proves remedial.

Sores on Teats

One of my pure-bred Holstein cows is afflicted on one teat which I describe as follows: It began about four months ago with hard lumps, about the size of large Lima beans, located between the skin and milk duct. They did not seem to be sore and after a short time the skin slipped off the one nearest the end and it became very sore. I ceased milking that teat and applied ointments and it healed, but the ones above broke and ejected a bloody pus and the swelling does not abate, nor does the swelling respond to treatment.
Howard, Colo. R. W. W.

Scratches or abrasions of the skin probably became infected by the filth germ, Bacillus Necrophorus, in the cases described and necrotic sores were the result. Immerse the teats for five minutes twice daily in hot water containing all the boric acid it will dissolve, then dry gently and apply iodin ointment. If that does not quickly prove remedial, apply glycerite of tannin instead of the ointment.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

For Barrenness in Cows, Mares and Sows, Use Hood Farm Breeding Powder

Astonishing Success in Making Barren Animals Breed — Indispensable After Abortion — Invaluable Where Cows do not Clean — Profitable to use on Every Cow After Calving.

Read what they say:
Hood Farm Breeding Powder is great and has been a God-send to me. I cannot be without it.
SULZER BROTHERS,
R. F. D. No. 2, Box 42, Hillsdale, Ore.

I have been using your Breeding Powder for eight years, when needed, and am well pleased with it.
HENRY C. STRIEKER,
R. F. D. No. 1, Germantown, Ill.

Prices of Hood Farm Breeding Powder prepaid, $1.15, $2.75 and $5.00. Price of Hood Farm Flexible Injection Tube by mail, 90c., or with a $5.00 order 75c. Please mention this paper.

C. I. HOOD CO., Lowell, Mass.

TEN GALLONS OF STERILIZER FREE

We will send you a sample of powder to dissolve in water and make ten gallons of the ideal disinfecting solution that prevents food spoilage, reduces the bacterial count in milk and destroys disease germs.

STERILAC
Disinfects — Deodorizes — Sterilizes

Many times as effective as carbolic acid yet so safe you can use it to purify drinking water for live stock or the home. Ideal for removing disease bacteria from all kinds of food-handling equipment; cream separators; milking machines; kitchen utensils and machinery; tables, shelves, floors; feeding and watering troughs and livestock.
Sterilac does not injure rubber or metal—is non-irritating and non poisonous. Withstands hot weather from 10 to 50 times longer than other disinfectants.

COSTS ONE CENT A GALLON

Bottle to make 75 gal. $1.00; to make 300 gal. $3.00. Comes as a powder—no loss from breakage, or freezing in transit, no heavy freight charges. Dissolve in water as you need it.
Ask your dealer or write us for free sample, TODAY.

Feb. 21-22, 1922—Holsteins. Iowa Holstein-Friesian Association's Annual Sale.

Waukesha Holstein Sale

Waukesha County, Wisconsin, held one of the most successful sales of the season April 25-26, selling 111 head for just short of $37,000, an average of $333.

Approximately one-third of the offering, 34 head to be exact, went to Indiana, Michigan, Illinois, and Iowa, with Indiana taking the majority. Five men were doing the buying from that state.

This is in itself convincing proof that the organization and publicity work Waukesha County Holstein breeders have done is paying dividends. Other county sales are most often local in character; Waukesha has for the last several years been able to attract buyers from a distance as well as from local territory.

The sale included two 32-lb. cows, both of them five-year-olds. Gewina Canary Pearl, sired by a grandson of Homestead Jr. De Kol and from a granddaughter of Piebe De Kol Burke and Pearl of the Dairy's Joe De Kol, was easily the best thing in the sale. She was a splendid individual, and the $2,200 bid for her was certainly not in excess of her value. She was consigned by M. P. Becker and purchased by Mrs. Z. A. Stealy of Illinois.

J. B. Johnson consigned the other 32-lb. cow, Black Bess Korndyke, a daughter of Fairview Pontiac Beets Korndyke. Her sister, sold a year ago through the same sale to Gustave Pabst, Wisconsin, has just finished a year's record of 1,270 lbs. butter. "Black Bess" sold at her worst, having just freshened. She was purchased by Ben Klima of Iowa for $1,500. Her yearling son by a son of K. K. S. V. topped the bulls at $1,000, being purchased by B. Felix of Indiana.

Mack, Love, and Benjamin did the selling with Reid Murray in the box.

Sec. W. L. Baird was sale manager.

Following is a list of those animals selling for $300 or more and buyers:

Baird Bros., Wisconsin	
Lilith Cornucopia Burke	$359

De Grove Bull, Wisconsin	
De Freule Pearl Dinkje	$410

Cough

Can you tell me why and what causes cows to cough that have passed seven successful tests for tuberculosis?

Derry Village, N. H. F. W.

When not due to tuberculosis, cough is often traceable to dust in the stable or lack of ventilation in a stable that is not kept clean. Standing in a cold draft is also a frequent cause and there are many others, but a personal investigation would be necessary to enable us to assign the exact cause.

If you miss the cheer of bulbs this spring, make a note to plant some next fall.

How long will your tractor last?

It all depends on what happens here

Here's where the wear begins—
Here's where the knock starts—
Here's where you lose power—
And here's where your real tractor depreciation takes place.

You can get just so much life out of these parts, and that life is not very long unless you use the right lubricant.

Texaco Tractoil is the right lubricant. It withstands the high working temperatures. It clings to the metal surfaces and by virtue of its paramount lubricating quality, it lessens friction—cuts down wear.

It has the right body. The body which is different from a motor oil because the work a tractor does, at full speed and constant load, demands a type of lubricant that is not found in any motor oil.

Use Texaco Tractoil. Use it right—a little extra attention toward lubrication will amply repay you in the longer life and the greater usefulness of your tractor.

A dealer in your neighborhood carries it in several grades in 33- and 55-gallon steel drums, in wooden barrels and half-barrels, and in 5-gallon sealed cans.

TEXACO Motor Oil

The uniform oil that keeps your motor active. It is a fine, lasting oil that completely retains its lubricating properties despite engine heat. It so perfectly seals the clearance between piston and cylinder, that no gasoline can leak into the crank case. Thus full compression is secured, and every last ounce of power used that the gas has to give. Be certain to get the can with the red Star and green T.

Common Sense and "One to Three"

HOARD'S DAIRYMAN:—Just what do we mean when we advise dairymen to feed grain according to milk production? This question has been bothering me for some time. It has sprung up dozens of times during the past 18 months. Again I see the common ratio "one pound of grain to each three pounds of milk produced" specified by Mr. Fruit in his letter published on page 512 of the April 8th issue of Hoard's Dairyman.

Years ago I noted that though our feeder stoutly maintained that he was feeding "1 to 3" as instructed, he invariably exceeded that amount, occasionally going above "1 to 2" in a month with 80 cows in the barn.

In February I went over the feed and milk records for a herd for the month of January. The owner said it was his plan to feed one to three but his record showed in even figures 10,000 lbs. of grain fed to the cows, not counting young animals, for the month of January, the yield being 20,000 lbs. of milk. He was surprised, and then recollected that there had been dry cows during January and some cows on test. Deducting the amount fed to dry cows the ratio was spread to "1 to 2½".

I have a twelve months' record for each of twelve herds from Sheboygan County for 1920. The combined average of the twelve for the year was a little less than one pound of grain to three pounds of milk produced. The herd average for four of these was practically one pound of grain to three of milk produced, but there the practice stops. The herd averages of the others ranged from 1 to 7, to 1 to 2½. Taking the herds separately the digression from "standard practice" is even more marked. In the winter months when production is low and part of the cows are dry into the bargain the feeding ratio exceeds one to two in several cases. It runs from that down to no grain at all fed while cows are on pasture.

It is also true that dry cows should normally be fed some grain for most economical results, but there is no feeding ratio at all in such cases unless it is the mathematical conception of "one to an infinitesimal" which doesn't mean much to a farmer—nor to anyone else perhaps. Practically our feeding standard means that a 6,000-pound cow will get a ton of concentrates in a year or one to three, and that a 9,000-pound cow will get a ton and a half more or less. But they will get these quantities in varying amounts during the year, say a base ration of four to six pounds of grain a day except perhaps for two to four weeks at the time they are being dried off and the balance in varying amounts, "according to production" up to 15 and even more pounds of concentrates a day.

Truly, "The eye of the master fatteneth his cattle". The milk producer, too, has to be on the job, all the time, with his brains as well as his feed scoop. There is no substitute for brains in feeding cows for milk production.

The recommended standard runs remarkably true to form in practice as "an average" over considerable periods, but, it seems to me, is strictly limited in the practice of good dairymen to a rough and ready general check on the amount of grain which is likely to prove profitable in the bulk of cases. This amount may be exceeded for good reasons—in the case of cows on test or in the case of necessity, as when other feeds are below the usual standard in amount or in quality **or** out of line in relative values. Or it may be very much reduced when other feeds are abundant and relatively cheap as in those cases where alfalfa hay and corn silage have been used year after year as the ration of the cows.

This is only another instance to show that averages have to be used with a great deal of common sense—that averages can't be followed blindly. Common sense in feeding is best developed by careful observation with the scales applied to the feed bucket and the milk pail every day.

Wisconsin. S. W. MENDUM.

Corn Insurance With Early Corn

HOARD'S DAIRYMAN:—It will soon be corn planting time, and perhaps many will be delayed in getting the seed into the ground. As a rule, we have most of our corn planted in good time, but sometimes bad weather and the putting in of a large acreage of spring crops will make one field or part of it several days late. Late maturing corn has proven a disappointment to us when planted late and it is caught by moderately early frosts, so we adopted the plan of raising some early maturing corn each year to supply us with seed when the occasion came to plant corn a little late.

It may seem like a simple matter to start in to raise an early corn, but it was three or four years before we found the kind and type most desirable to our purposes. One or two supposedly early varieties turned out

to be too late maturing when the seed was planted near the first of June, some were shallow grained with too large a proportion of cob to corn, and the white varieties did not appeal to us because their feeding value is not as high as the yellow corn.

Finally we secured a yellow variety that matures from ten days to two weeks earlier than our late corn. It has a small cob and a deep grain, which is well proportioned and has a high feeding value. It yields nearly as well as the later varieties, but even if it does not yield quite as well we have the advantage of having well matured corn. I would rather have fifty bushels of solid, mature corn than sixty bushels of immature corn, and I believe most other farmers would also. When we can get our corn planted in good season we prefer the later maturing corn because of its higher yielding qualities. If conditions are very favorable at planting time, which may be once every two or three years, I believe the early corn will yield remarkably well.

The early corn may be counted as a kind of insurance against soft corn when planting has been delayed for ten days to two weeks. When we are able to get all our corn planted in good time we plant all of the late maturing corn except for a few acres which are planted to early corn in case seed of the early corn should be needed the following season, then select the seed for purposes of improvement in both the corn and the yield.

This early corn is also very desirable for replanting, either where the stand has been thinned by ants or cutworms or is a complete failure due to unseasonable weather or other adverse conditions. Usually it is a week or more after planting before one is able to determine fully what per cent of a stand has been obtained, and it is often two weeks or more before the full extent of damage done by weather and insects is known, so in either case where replanting must be done one will be getting the corn in from one to three weeks late. An early variety comes in good under these circumstances, and while I may say we have not had to resort to the early corn very often it has been used to good advantage when necessary.

Why trouble to grow early corn for seed when it can be purchased in an emergency which may not be more than one year out of three to five years? Two good reasons come to mind; first, you do not know anything of the performance of the corn you buy or its adaptability to your soil and methods of culture. It is only by testing out several varieties or strains in a few rows that these things can be determined to your satisfaction. Second, if you have not tried out the seed you will hesitate to buy at the last moment, in fact there may not be time to secure the seed, and a chance will be taken with the late corn. There is a great deal more satisfaction in knowing what the corn will do on your farm and with the evidence and a good supply of seed one does not hesitate to plant it.

Indiana. J. L. JUSTICE.

Save Silo Doors

HOARD'S DAIRYMAN:—Most silos have loose doors. They are apt to be misplaced during the summer so that when filling time comes there is a hunt for them. I have found that the best way to keep the doors in place is to leave the top door at the top of the silo when starting to feed. Then as each door is taken out slip it in the door frame above. When the bottom is reached there will be one empty space. This is not serious as one wants an open door when filling the silo. Then just shift each door down one frame as the silo is filled and at the top is the extra door needed to complete the job.

An advantage of this method is that the silo is much stronger during the summer when it is apt to be empty. The doors prevent the wind getting a twist on it and help to make the whole silo more rigid.

MIDDLESEX MEADOWS FARM
OFFERS
Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.

Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we KNOW you can't get as good as these two for any less money elsewhere.

A. Henry Higginson (Owner). W. R. COUTTS, (Supt.)
South Lincoln, Massachusetts

Washington, D. C., Weekly News

[Special to Hoard's Dairyman]

WASHINGTON, MAY 2—Congress has settled down to its steady grind. The naval bill, one of the two appropriation bills left unfinished, which created the emergency requiring the calling of this extra session, has been passed, and the House is hard at work on the army appropriation bills. The generally accepted administration measure for naval affairs went through the House without difficulty, and a proviso to withhold the ninety millions in the bill for battleship construction until the President could call a disarmament conference, failed by a large majority. The administration measure for the army, however, is having hard sledding, and the wishes of the Department of War for an army of 175,000 has already been voted down and 150,000 substituted, against the protests of administration leaders. Meanwhile the Senate has received the emergency tariff bill as passed by the House, and also the immigration restriction measure and they have been under committee consideration while the Senate as a body passed the Columbian treaty, strictly an administration measure, and the Knox Resolution declaring a state of peace with Germany.

These matters out of the way, the Senate on May 3 began consideration of the emergency tariff measure, which has right of way, and is considered the chief measure of agricultural interest in the administration program.

The Senate Committee on Agriculture has before it a number of measures of general agricultural interest, including especially the Kenyon (Milliken) rural credit measure, but has as yet made little progress in any measure designed for special agricultural interest. It appears that the lead will be taken for a time at least by the House Committee which has completed a week's hearings on grain gambling legislation and is apparently about ready to report a bill, and has begun packer control bill hearings, also with the appearance of having a bill in sight which can be reported, and stand a chance of enactment. There has never been as good an outlook for legislation on this much discussed subject as at this time.

What's a vacation, asks the farm woman? Seven-eighths of them year-in and year-out never have one.

Broad Ripple Farm Guernseys

Offered In An

Absolute Dispersal Sale

May 19th, 1921, Waukesha, Wis.

Live Stock Pavilion

44 Registered Guernseys

Geo. W. Browne
Owner

An exceptionally fine opportunity is given breeders to purchase some very fine Guernseys in this sale. The best of breeding is represented in the pedigrees, and the individuality is especially good. A. R. cows with records as high as 644.86 lbs. butterfat are offered.

Females bred, are bred to the herd sire, Rex of Broad Ripple, whose dam has a record of 797.7 lbs. butterfat and is a daughter of the great bull, Langwater Hayes Rosie's King of the May A. R. Positively every animal will be sold. No by-bidding permitted, by guarantee of Sales Manager.

Such splendid individuals as the following are offered:

REX OF BROAD RIPPLE NO. 61960, whose dam has a record of 779.7 lbs. butterfat.

Dispersal Sale of

Folly Farm Guernseys

Owned by R. H. Donnelley, Libertyville, Ill.

To be Held at the Sale Pavilion

Fond du Lac, Wis., June 4th

The character of the cattle in this sale we are sure is second to none to be held this year. The herd bull Allenwood King Regent is the sire of 8 A. R. daughters and several more under test. One is a class leader. Fourteen of his daughters in the sale. Average record of his three nearest dams 822.31 lbs. fat, which is, we think, the highest for any bull of the breed.

Of the 35 females in the sale 20 are cows and 19 of these are in the Advanced Registry, or are now under test. Two of them are Class Leaders.

Included in the Lot are:

Mavoureen of Pencoyd 583.91 lbs. fat. Fifth in Class DD.

Folly Laura 572.09 lbs. fat. Eighth in Class GG.

Doris of Sarnia just finished over 600 lbs. fat.

Constance of Sarnia, 518 lbs. fat.

Corrina of Sarnia, 542.37 lbs. fat.

Lady of Tamworth, 519.04 lbs. fat.

Langwater Queen Mab, 440.2 lbs. fat Class D.

Fillmore's Topsy, 490.53 lbs. fat Class F.

St. Austell's Daybreak, a daughter of Don Diavolo of Linda Vista, now making a very large record. Many others of same class.

See the "Dairyman" of next week for full list of these A. R. cows with their records. Then send for catalog and attend the sale.

Chas. L. Hill, Sale Manager, Rosendale, Wis.

See adv. of Fond du Lac and Winnebago County Sale at Fond du Lac on June 3rd.

Fourth Semi-Annual Sale

OF THE

Fond du Lac Co. and Winnebago Co. Guernsey Breeders' Ass'n's

Sale Pavilion

Fond du Lac, Wis., June 3d

60 Head of High Class Females and 10 Bulls

Among the bulls are those out of dams with records of 678 lbs. fat Class F, 618.89 lbs. fat Class B, 507 lbs. fat Class B, 589 lbs. fat Class A.

Many A. R. cows or cows now under test and heifers out of this class of cows, and others nearly as good.

Cows and heifers in calf to such noted bulls as Cherub's Prince, Superb of Edgemoor, Dairymaid's Nonpariel of Iowa, Pencoyd Leader, Pencoyd Crackerjack, Langwater Kinglike, Sunkiston, Rex's Champion of Maple Hill, Jessy Rose's Pride of Iowa, Queen's Golden, and others as good.

Come to the great picnic of the Fond du Lac County and Winnebago County Guernsey Breeders' Associations at Lone Tree Farm, Green Lake, Wis., on June 2nd, and then to this sale at Fond du Lac on June 3rd.

Look up our advertisement in the Dairyman next week, and send for catalog. Then attend the picnic and sale.

F. E. FOX, Sales Mgr., Waukesha, Wis.

Virginia Holstein Sale

On April 15, 1921, there was held at Richmond a Virginia breeders' consignment sale of Holstein-Friesian cattle. Seventy-four consigned to this sale sold for a total of $22,230.

The top cow was a 7-year-old, Dixie Butter Bess, consigned by F. R. Chambers and purchased by Brentwood Farm, Pennsylvania, for $910. The value placed on this cow in the sales ring was due not only to her being a daughter of the famous sire, Hengerveld Pontiac Korndyke, but also to the fact that she shows wonderful type and individuality.

The top bull in the sale was consigned by Brentwood Farms and sold to Carr Brothers & J. R. Wingfield of Virginia for $605. This bull, King Model Vale, is a son and a grandson of King Model. He is a splendid individual and shows lots of quality. He goes to a good Holstein community in Virginia and is a valuable addition to the Holstein breed in the state.

The 67 females averaged $305.62 and the seven males averaged $250. It was very evident from the prices paid that the buyers placed more value on outstanding type, individuality, and good condition than upon blood lines. The consignments to this sale gave evidence that Virginia breeders of Holsteins are giving more consideration to quality and type than has ever before been shown in a sales ring of Holstein-Friesian cattle in Virginia.

The majority of the buyers were from Virginia, only 20 head going out of the state.

Following is a list of animals selling for $350 or more, and buyers:

R. W. Massie, Virginia	
Alma Riverside Cornucopia	$365
Emma De Kol Soldene	435
Huntington Valley Farm, Pennsylvania	
Forest Dale De Kol Korndyke	$435
Margaret Aaggie Korndyke	780

Badger Stock Farms, Hartford, Wis. Lawrence F. Murphy

BUY DIRECT Reasons for Buying Holstein Cattle in Waukesha County:

1. You can buy direct from the breeder through the breeders' association, organized by the breeders to promote the breeding of more and better Holstein cattle and to assist in a fair marketing of the same.
2. There are over 50 pure-bred Holstein sires in service in Waukesha County whose dams have records of over 30 lbs. butter in 7 days or 1,000 lbs. butter in a year.
3. There were 1,307 long-distance tests made on Holsteins in Waukesha County during the past year, which is more than the total in the next four leading counties in the state.
4. There are more tuberculin tested cattle in Waukesha than in any other county in the world.
5. The breeders' organization is in a position to put you in touch with "bred-for-production-stock" at reasonable prices.
6. When buying through the Association, you obtain the services of men who devote their entire time to the Holstein industry. It saves you time. You get more for your money.

Sheboygan County Holstein Breeders'

Consignment Sale

Plymouth, Wis., May 20

65 Head 65 Head

Do You Appreciate Records? Do you want some Holsteins with Wonderful A. R. O. backing? If so, Plan to Attend This Sale.

Sheboygan County Holsteins are Noted for their Records, both 7-day and Yearly.

Nearly all the animals in this sale are from record dams, or have records of their own.

YESLETINE BESS 240108

28.10 lbs, butter, 670.2 lbs. milk; 105 lbs. milk high day.
CONSIGNED BY S. A. EASTMAN, PLYMOUTH, WIS.

There will be:

A Dandy Heifer, a faultless individual, daughter of King Pietertje Ormsby Piebe 7th, whose three nearest dams average 1110 lbs. Her dam is a 28.68-lb. 4-year-old, now on yearly test, and making a good record.

Daughters of Pabst King Hengerveld, a 1057.15-lb. son of King Pontiac Champion.

Daughters of Sir Ormsby Beauty Pontiac Segis, who is from the Highest Record daughter of Count—37 lbs. for 7 days, and 1121 lbs. for the year. They are in calf to Cedar Lawn Canary Paul 4th.

Also a fine 17.09-lb. 2½-year-old, in calf to the Ormsby bull.

Three daughters of Sir Longfield Pearl Spofford, whose first three dams average over 1000 lbs. One from a 700-lb. dam with 16,000 lbs. for the year; one from a 900-lb. dam with 22,234.6 lbs. for the year; and one from an 18.64-lb. 3-year-old.

Two nice heifers sired by the 30-lb. bull, Canary Fobes Inka Homestead, and in calf to King Abbekerk Pontiac Segis 3d, a 31.39-lb. grandson of Count.

Good producing cows in calf to Pabst Korndyke Cornflower, Cedar Lawn Paul Champion, Pabst Pontiac Adonis, and to a son of the $50,000 bull, King Segis Pontiac Alcartra.

Cows and heifers on test at present time. Records will be announced at sale.

A Yearling Bull, sired by Pabst Pontiac Adonis, a son of the great 38.43-lb. heifer, Pabst Korndyke Cornflower, who sold at the 1920 National for $30,000. His dam has a record of 353.42 lbs. butter and 7963 lbs. milk in 5½ months.

A December bull calf sired by King Pietertje Ormsby Piebe 7th, whose 5 nearest dams average 1110 lbs. from 23,080 lbs. milk. The dam of King Pietertje will soon finish her second year with about 1000 lbs. butter as a junior 3-year-old.

An October bull calf, sired by Sir Longfield Pearl Spofford, a yearly record bull whose dam has an 891.35-lb. 4-year-old record, next dam 1215 lbs., and whose sire's dam has a 972.56-lb. record. The dam of this calf is an 18.37-lb. junior 3-year-old.

A November calf sired by King Abbekerk Pontiac Segis 3d, a 31.39-lb. grandson of Count.

Third Annual Sale
Manitowoc County Holstein-Friesian Breeders

May 18-19, 1921

Held at the Fair Grounds

Manitowoc, Wis.

140 Pure-Breds

The choicest lot of cattle ever assembled in Manitowoc County will be sold at auction including 10 males whose dams have ADVANCED RECORDS up to 21.60 lbs. butter in 7 days as two-years-olds.
8 females with dams A. R. O. records up to 20 lbs. as two-year-olds.
Males and females from dams as high as 27 lbs. A. R. O.
1 male whose four nearest dams averaged 25 lbs. A. R. O.
A good bunch of young stock whose sires' three nearest dams average 33 lbs. A. R. O.
14 head sired by 33-lb. sire.
Several females from dams of 20 lbs. as three-year-olds.
2 four-year-old show cows with 21.60 lbs. and 22 lbs. A. R. O. records in the sale.

30 High Grades

Several males from 22-lb. dams and over.
Manitowoc County has, since the last sale, added many 30-lb. sires or the equivalent of 30 lbs., also several 1,000-lb. yearly bulls. A good number of these animals are bred to these bulls. Also young stock of these bulls in this sale.
You can't make a mistake by buying stock at this sale. All cattle females guaranteed to be breeders. All animals over six months tuberculin tested.
Every animal inspected by the Manager and Board of Directors. We are building up a Quality Sale. We want to hold a sale every year, for that reason we offer only quality cattle. Real show cattle are offered. Manitowoc County is fast becoming one of the leading Holstein counties. Come and see these cattle. Look them over. We will be glad to show you what we have. We will give you courteous treatment and do all we possibly can to help you pick the best.

HENRY J. KARPINSKI, Route 7, Oswego, N. Y.

THE MARK OF QUALITY

Count AND Ormsby Blood

To those breeders who are using sons of Count or breeding Ormsby blood this young bull should be especially attractive.

Sire:

Sir Ormsby Hengerveld Korndyke, son of Pietertje Maid Ormsby, 35.56 butter. His sire, Sir Korndyke Hengerveld De Kol, sire of 45 A. R. O. daughters, including Miss Korndyke Akkrummer Ormsby, 39.53 butter.

Dam:

Eureka Melissa Segis 21.93 lbs. butter, 7 days, and is finishing up the year well over 750 pounds. Eureka was sired by a full brother to King Segis Pontiac Count, "the marvel of all sires," her dam Eureka Melissa 25.08 lbs. butter by Paul Beets Walker, sire of 44 A. R. O. daughters.

Send for Pedigree

HOLSTEIN FEMALES

Females of all ages for sale, priced very reasonable Mostly all bred to our 34-lb. sire, he a grandson of Count, from a sister of Piebe. One or a carload. Under State and Federal supervision.

BLACK & WHITE STOCK FARM, R. 3, **Melrose, Minnesota**

Fairhurst Herd

On the Accredited List

We offer young bulls, fine individuals and well grown. Sired by 33-lb. bull and from dams with records up to 30 lbs. Write for pedigree and price.

KITTLE BROS., **Holland, Ohio.**

Yearling Bull — Ready For Service

Here is a show bull whose sire is by a son of KING KORNDYKE HENGERVELD ORMSBY and out of a 37-lb. cow. His dam is backed by many yearly records. He is priced at half his value—$125.

G. G. Burlingame, **Cazenovia, N. Y.**

MISSOURI HEALTHY HOLSTEINS

"We'll Pay Your Car Fare Both Ways"

Second Annual Sale of

"Missouri Healthy Holsteins"

State Fair Grounds

Sedalia, Mo., May 24th, 1921

SHOW MAY 23. BANQUET AT NIGHT.

Every animal passed on by the committee. None over 8 years old. All guaranteed sound. 90-day retest.

36 Cows, 26 Heifers, 9 Heifer Calves, 11 Bulls

Yearly, Seven-day and Cow Testing Association Records.

Auctioneers—Mack & Ball **Wood in the Box.**

Sale Committee—Fisk, Davis and Long.

For Particulars Write

Mo. Holstein-Friesian Ass'n, SEDALIA, MISSOURI

Complete Dispersion of M. D. Buth's Herd

May 26, at Comstock Park, Mich.

65 Registered Holsteins Including 20 from Maryland Farm owned by Dudley E. Waters.

4 cows with records from 30 lbs. to 38.9 lbs. and 7 of their sons and daughters.

5 with records of 25 lbs. to 30 lbs. and their daughters.

40 females in calf to Glen Cilex King De Kol, (40-lb. bull).

16 daughters of Colantha Sir Korndyke Clothilde, with records up to 22 lbs. as 2-year-olds and 29 lbs. as 4-year-olds.

60—90-day retest.

Autos will meet street cars from Grand Rapids at Comstock Park.

M. D. BUTH, **Comstock Park, Michigan**

Central Mich. Sale May 23. Jno. M. Tobin's Dispersion May 24. Mich. State Sale May 27.

MR. CATTLE BUYER

We can supply you with good, healthy registered Holstein cows and heifers, singly or in car lots. We always have some very desirable young bulls for sale. It will pay you to look into our high class listings.

LENAWEE CO. HOLSTEIN BREEDERS' ASS'N, ADRIAN, MICH.
L. W. Harwood, Sales Mgr. **R. C. Curtis, Sec.**

The Pontiac Herd

"Where the Champions come from"

Offer Bull Calves sired by sons of *Pontiac Korndyke, Hengerveld De Kol, Pontiac Dutchland, or Admiral Walker Pietertje.*

Do you want a Pontiac in your herd?

PONTIAC STATE HOSPITAL, **Pontiac, Mich.**

THE TRAVERSE HERD

We have what you want in

BULL CALVES

the large, fine growthy type, guaranteed right in every way. They are from high producing A. R. O. ancestors. Dams' records up to 30 lbs. Write for pedigrees and quotations, stating about age desired.

Traverse City State Hospital, - **Traverse City, Michigan**

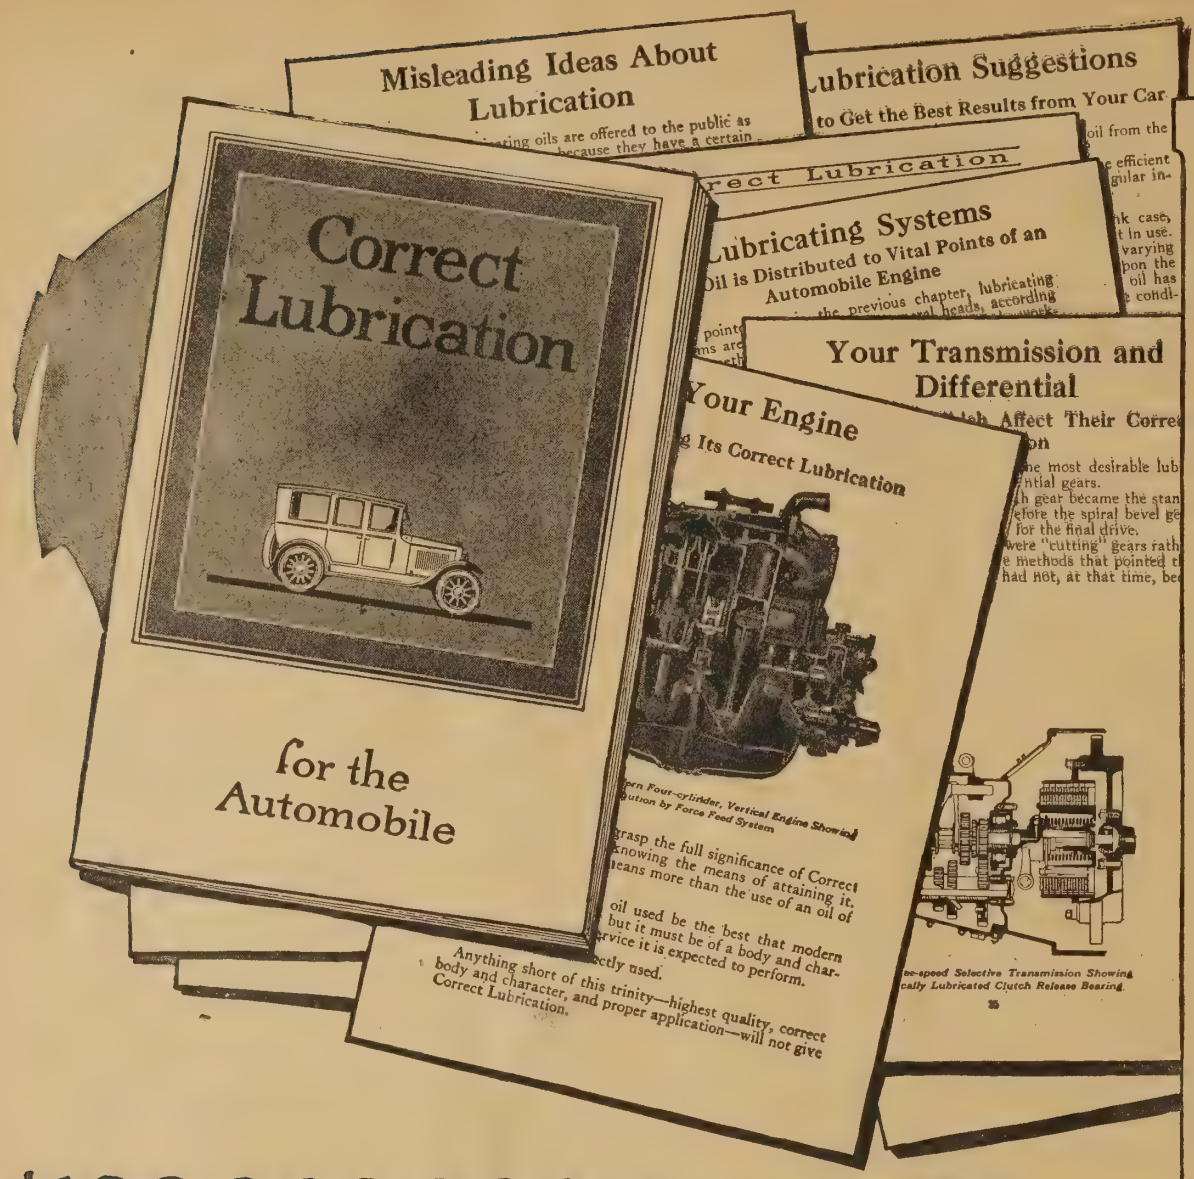
A Grand Yearling Bull

Sired by a son of KING KORNDYKE SADIE VALE from a 32.74-lb. 3-year-old dam. His dam, a 22-lb. 4-year-old, is now on year's test. The second month on test she made 2,450.0 lbs. milk and 100 lbs. butter. Her sire a double grandson of KING SEGIS. She is closely related to the world's wonder cow, BEECHER WYTHE 2D.

A Federal Accredited Herd

Price $250.00

M. J. SEBERGER, **Schererville, Indiana**



Holstein Bull Bargain

Royal Breeding—Splendid Individual

Carries 43¾% blood of Pontiac Korndyke, the greatest of all sires, 25% of blood of King Segis Pontiac and 12½% blood of King Segis. None better. 4 others ready for service. First $250.00 check gets him.

Wm. N. Osborn, **Wanatah, Ind.**

YOU CAN'T DO BETTER FOR THE MONEY. Bull calf born Aug. 17, 1921. Mostly white, a show bull and well grown. His 3 nearest dams average 28.47 lbs. Sire is a 32.7-lb. grandson of King of the Pontiacs. Send for pedigree and photo. Have only 2 other bull calves besides this one. C. I. REAMER, Prop., Utopia Dairy Farms, North Liberty, Ind.

$100,000,000 Repair Waste

Let this Booklet cut down your engine and chassis troubles and repairs

EVERY automobilist who wants to cut down repair bills should have this Booklet. It strikes its keynote in the opening sentence, "*One half of every dollar spent for automobile repairs is wasted!*"

Every year American motorists spend at least one hundred million dollars unnecessarily for engine repairs.

Our Booklet, "Correct Lubrication," diagnoses the cause of much of this immense national waste. It deals simply and scientifically with first causes.

It discusses causes of repairs, engine factors, lubrication factors, carbon formation. It describes oil tests—where they are important—where they mean nothing, or worse than nothing. It deals with transmission and differential lubrication, explaining why lubrication practice of a few years back is today obsolete—why old practice points to repair bills.

The temptation to use heavier oil in worn engines is dealt with. The Booklet points out the penalties which come from this dangerous practice.

* * *

You may think that you have no avoidable repairs. *So do millions of other motorists! And they are the very men who contribute to the hundred million dollar repair fund which represents sheer waste.*

Motorists need information on this vital subject. This information is provided for you in our Booklet, "Correct Lubrication." The 1921 edition is now ready. It contains the facts. They are simply presented—easy to get at, easy to read, easy to understand and *easy to apply immediately to your financial advantage.*

The Booklet is free. Send for your copy today. In writing, please address our nearest Branch.

GARGOYLE

Mobiloils

A grade for each type of motor

DOMESTIC BRANCHES: New York *(Main Office)* Philadelphia Detroit Minneapolis
Kansas City, Kan. Boston Pittsburgh Chicago Indianapolis Des Moines

Chart of Recommendations *for* AUTOMOBILES

(Abbreviated Edition)

GARGOYLE

Mobiloils

A grade for each type of motor

How to Read the Chart

THE Correct Grades of Gargoyle Mobiloils for engine lubrication are specified in the Chart below.

A means Gargoyle Mobiloil "A"
B means Gargoyle Mobiloil "B"
E means Gargoyle Mobiloil "E"
Arc means Gargoyle Mobiloil Arctic

These recommendations cover all models of both passenger and commercial vehicles unless otherwise specified.

Where different grades of Gargoyle Mobiloils are recommended for summer and winter use, the winter recommendation should be followed during the entire period when freezing temperatures may be experienced.

This Chart is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and constitutes a scientific guide to Correct Automobile Lubrication.

If your car is not listed in this partial chart, consult the Chart of Recommendations at your dealer's, or send for booklet, "Correct Lubrication," which lists the Correct Grades for *all* cars.

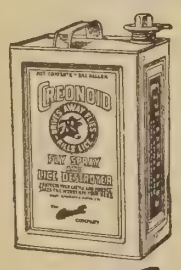
Fort Atkinson, Wisconsin Volume LXI, No. 18 May 20, 1921

Creonoid will keep your horses and cows free of flies.

Morgan Shumetz

Fighting Flies or Pulling Plows



HORSES can do only a certain amount of work. The more energy they use fighting flies, the less they have for pulling plows and other farm work. So, if you want good hard work out of your horses, you must fight the flies for them.

That isn't merely horse-sense—it's a proved scientific fact.

Creonoid, sprayed lightly on the legs and bodies of the animals, will keep the flies away. No special apparatus is required. Any sprayer that throws a fine spray will do the work.

Creonoid is safe, lasting and does not gum the hair.

Painting rubbing post and spraying chicken roosts with Creonoid keeps away lice and mites.

CREONOID
FLY SPRAY AND LICE DESTROYER

Cow Spray: Creonoid is also unequalled as a fly spray for cows. When cows are free from the torment of flies they are contented and comfortable, digest their food properly, give more milk, and the lactation period is lengthened.

For Chicken Mites: Droopy, unhealthy, poor-laying hens are almost a sure sign that the chicken house is infested with mites. Creonoid will rid you of this pest. Your hens will quickly improve in appearance and will lay more eggs.

For Hog Lice: Lice suck the blood of hogs and keep them from fattening. Creonoid is a sure remedy. It means more pounds per hog and more profits.

You don't experiment when you use Creonoid. It is a well known product that has been on the market for many years.

Comes ready for use in 1 and 5 gallon cans and in 50 gallon barrels. Easy to apply, inexpensive, effective. If your dealer can't supply you, write to us. Ask for free booklet, describing methods of applying Creonoid.

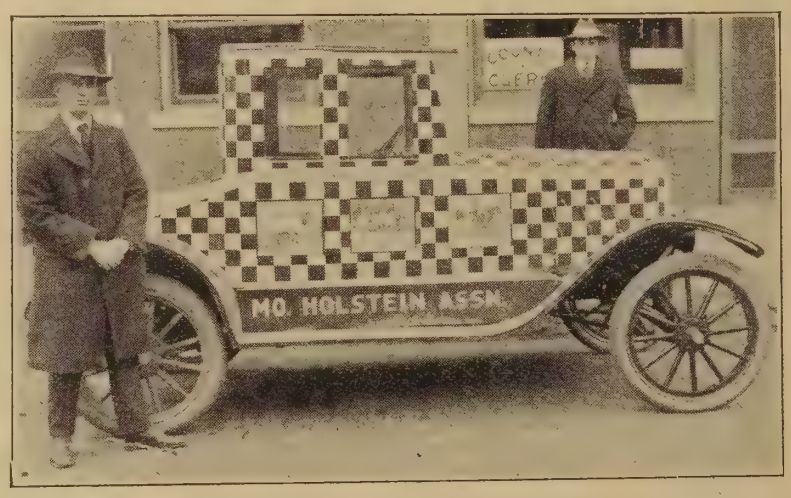
From Fords to Holsteins



C. M. LONG, MISSOURI

THE Missouri Holstein-Friesian Association thinks that if Ford is going to make tin cows he should make them in the image of Holsteins and have therefore made him a pattern which we show herewith.

This is the car the association has provided for its fieldman. In addition to being painted black and white another novel feature is that large pictures of six Holsteins noted for their breeding, show ring performance, or production or all three, have been placed under plate glass around the sides of the car. These are used to advertise the breed and are used by the fieldman to demonstrate type and production when he meets the agricultural classes in the high schools throughout the state.

The Holsteins used are Tilly Alcartra owned by Morris & Sons of California; Oak De Kol Ollie Homestead owned by Iowana Farms, Iowa, and twice grand champion at the National Dairy Show; Ona Clothilde De Kol, the dam of four generations of 1000-lb. cows owned by Peter Small of Ohio; King Pontiac Hengerveld Fayne, the great son of King of the Pontiacs owned by Cold Stream Farm, Kentucky; and Echo King Sylvia, noted son of May Echo Sylvia and herd sire at Bell Farm, Pennsylvania; and Finderne Fayne Johanna Rue, the only living 1400-lb. cow.

The car will be on exhibition at the first annual Holstein show which will be held at Sedalia, May 23, the day before the association's second annual sale. The fieldman is getting great results in his calf club campaign, clubs ranging from thirty to seventy head have been organized in Johnson, Lafayette, Cole, St. Charles, St. Francis and Green Counties, and other counties are urging him to come and organize for them. Plans have been made at Springfield with the Chamber of Commerce and Farm Bureau to launch a fifty-thousand-dollar breeding campaign on the Pettis County plan.

Clean-up, Cheer-up Week

The American Jersey Cattle Club has designated the week of May 30th to June 4th as "Clean-Up, Cheer-Up Week" for Jersey breeders. "For one solid week," says the Club, "we ask the close co-operation of every state and local Jersey breeders' association, every regional field unit, and every Jersey breeder and every Jersey Scout in the taking up of some part of this universal boost. Let us shake off the lethargy of the 'reconstruction period,' roll up our sleeves, and make our business hum by work, hope, and enthusiasm."

State and local Jersey clubs are asked to arrange for prominent window displays in the stores of their communities, to send circular letters to their members telling about Jersey Week, to take part in local newspaper advertising campaigns, and to call a meeting of the breeders for that week, arranging an attractive program. Jersey breeders are asked to follow the plans laid down by the state and local clubs and to run advertising at least one day during Jersey Week to send in all possible registration and transfer papers, to get at least one new Jersey breeder started, to push the Jersey Scout organization, and the boys' and girls' Jersey calf clubs and to put at least one more Jersey on official test.

Valuing Milk in Wisconsin

HOARD'S DAIRYMAN:—I notice in a recent issue of the Dairyman that Wisconsin milk was valued at $2.56 during 1920. This was found in the report of the Crop Reporting Service, the figure for 1919 being $2.82. These were presumed to be the prices that the farmer received for milk during the past two years.

While I do not doubt the accuracy of this statement, yet I am led to wonder how the average Wisconsin farmer is marketing his product. I find that my Guernsey cows will return more than the figures given, even though their milk is sold as cream to a creamery. During 1919 I received, on an average, 67.22c net per pound of butterfat at my farm. In 1920, I received 66.86c per pound fat. On the basis of these prices, I received in 1919 $3.19 per cwt. and in 1920, $3.17 per cwt., the milk from my herd testing 4.75 per cent. If my milk had tested only 3.5 per cent, I would have received $2.35 in 1919 and $2.34 in 1920, which is only slightly under the figures given in the report previously mentioned.

In the above returns I have not credited my farm with the value of the skimmilk, which I figure was worth not less than 75c to $1.00 per hundred pounds in 1919 and not less than 50c to 75c in 1920. This skimmilk was used for feeding hogs and good grade dairy heifers.

If the crop report is correct, then it would seem to me that the much vaunted advantages of the condensery as a market for milk do not hold good in actual practice. The market which I have for cream is not the best market available in Wisconsin but it may be superior to that of some other men. None the less, the discrepancy between figures given is somewhat startling to me.

Wisconsin. J. S. CHARLES.

HOARD'S DAIRYMAN

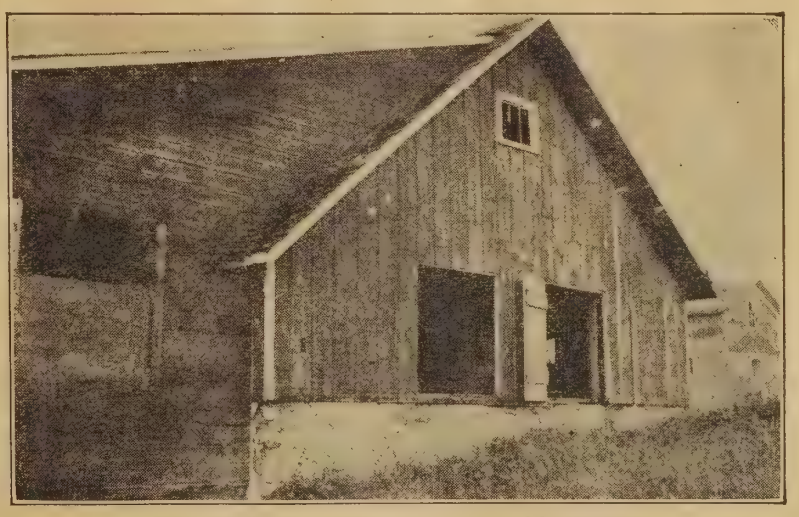
Volume LXI — FORT ATKINSON, WIS., MAY 20, 1921 — Number 18

EARLY SILO HISTORY IN THE U. S.



THE accompanying illustrations of two early Wisconsin silos bring up again the history of the silo and its development. In the files of Hoard's Dairyman of some thirty years ago, we find the following reference to the first silos built in America:

"Dr. Manly Miles, having learned about silos in France, in 1875 made two small ones that gave satisfactory results. Francis Morris of Maryland built the next one in 1876. These were the first American silos. Bailey of Massachusetts built a silo in 1880, and the next year Oatman Brothers of Illinois claimed to have built the first one in the West."

From conversation with men who were in the dairy business at that time, we find that probably the first silo in Wisconsin was built as the result of the publication of a government report in 1876 on the making of silage in European countries. The next year Mr. Levi P. Gilbert, residing on a farm near Fort Atkinson, decided to try out the recommendations made in this publication and, during the summer of 1877, he built what was probably the first silo in Wisconsin and one of the first in the United States. He cut a trench 8 ft. deep in a sharp crowned knoll by the use of a plow, a team, and a scraper. This trench was 8 ft. wide at the top and 5 ft. wide at the bottom. He built up the sides of the trench with boards and two-by-fours, leaving the earth to form the ends of the box or pit. This was built large enough to hold between two and three acres of corn. There were no silage cutters available at that time so it was ensiled in bundles and stacked somewhat above the ground level. After the filling was completed, the top and sides were covered with straw and dirt.

The late Mr. C. P. Goodrich, the veteran Wisconsin dairyman, told us shortly before his death that in November, 1877, he examined a sample of the silage from the Gilbert silo. He said: "This was the first silage taken from the first silo built in Wisconsin. It was quite sour and had a slight smell of alcohol, the corn having been quite immature when put into the silo."

What was probably the first above-ground silo built in Wisconsin was erected by Dr. L. W. Weeks of Oconomowoc in 1880. This silo was built of stone and grout to a depth of 12 feet, and had a superstructure of wooden walls, double boarded on the inside, that brought the entire depth to about 20 feet. It was 14 feet wide and 30 feet long, this in turn being divided lengthwise into three compartments. The bottom of the silo was three feet below the floor of the cow stable into which it opened.

THE FIRST ABOVE-GROUND SILO IN WISCONSIN

This silo was built in 1880 on the farm of Dr. L. W. Weeks in the town of Summit, Waukesha County, Wisconsin. It is 14'x30'x20'; divided into three compartments. The silo has been in use until recently, and the photograph from which this illustration is made was taken last summer. The farm is now owned and operated by Mr. Fred Pabst as a part of his large Holstein breeding establishment.

Mr. Stallard, former county agent of Waukesha County, interviewed one of the old residents who lived near Mr. Weeks. "I recall distinctly," he said, "that the silage from Mr. Weeks' silo was very good and that it kept well. The neighbors talked a great deal about the injury that this silage would do to the cows that ate it, that it would make their teeth fall out and eat out their stomachs. They laughed at Mr. Weeks but now every farmer thinks he must have a silo or he can't keep dairy cows."

The same year that Mr. Weeks built his silo another Waukesha farmer built one. This was Mr. John Steele who is still living and, in a recent letter to the Wisconsin Farmer, tells the following interesting story:

"My experimental silo was built in 1880 by using half of a root cellar. It held about 20 tons. At Oconomowoc on the day I got my cement to fix up my silo, the dealer told me that Mr. Weeks was filling his silo that day. I went over to see him do it. The corn was very green, but he was cutting it fine and packing it well. It was about ten days later before I got ready to fill mine.

"I got help and filled it in one day, covered it with double boards and put a foot depth of stone on the top. There was never better silage made. In 1881 I was a member of the assembly at Madison and served on the agricultural committee. Professor Henry wanted an appropriation to experiment on silage and sugar cane. I was the only man in the assembly that knew anything about silage, and that was very little. Secretary Bryant of the agricultural association had got a sample of Mr. Weeks' silage to show at the meeting and it was so different from mine that I was ashamed to show any. I did not know at that time that mine was really the better sample of the two.

"In 1881 I tore down my experimental silo and built my present one, but was late in getting it filled. Finally I filled it with about 100 tons, and covered it with double boards and over a foot of stones to press it down. There was never better silage. Next year I thought I would fill it with greener corn. One of my neighbors built a silo and we worked together on the job of filling. I let him fill his first, thinking that I was doing him a favor, but neither one of us had good silage, as it was too sour. I then found out that it did not pay to fill fast with too green silage. My silo stands here today just as good as it was 40 years ago, and it has been filled regularly every year since that time."

In 1882 a stone silo was built by Professor Henry on the University Farm at Madison. Various crops were ensiled, including corn, clover, and other grasses. "To store corn in a well built silo," said Professor Henry in 1886," is seemingly the best way of getting all there is in a corn crop at time of ripening. The only amendment that a quarter century of experience would make would be to omit the word 'seemingly'."

By 1886 there were something over a hundred silos in Wisconsin, at which time John Gould of Ohio came to Wisconsin to speak as a "silo missionary". His work was effective and the silo commenced to gain in favor, but it was not until the later nineties that the silo became generally popular. Since that time they have increased greatly in number until practically every man keeping twelve or more head of stock has at least one silo. The latest figures available indicate that Wisconsin has today something over seventy-five thousand silos, which is more than any other state can boast.

In connection with what has been said before, it may not be out of place to quote here what Professor F. W. Woll has to say about the origin and early use of silage. In his book on Silage, which was prepared some 25 years ago, he says:

"The history of the silo dates back to antiquity. Ancient writers speak of the practice of burying grain in underground pits to save it for future use or to hide it from their enemies, and the evidence at hand goes to show that semi-barbaric peoples in the different parts of the world have known and practiced this method. Green forage was preserved in the same way in the early history of the races of Northern Europe, notably in Sweden and the Baltic provinces, where the uncertainty of the weather and the low summer temperature rendered difficult the proper curing of the hay. It was not, however, until toward the middle of the present century that the practice of preserving green fodder by means of pits in the ground became more known. The method was especially practiced in Central Europe, where large quantities of green leaves and tops were

(Continued on page 768)

AN EARLY WISCONSIN SILO

Brown County claims to have been one of the pioneer counties in the State of Wisconsin in the construction of silos, one of the first silos being erected on the farm of Charles Schmidt in the town of Wrightstown. In 1883 Schmidt's father, an early settler, feeling the need for a silo put up the square building which still stands. The silo was used continuously up to 1899 when a round silo was erected in its place. The old silo has a wooden lining with an air space of eight inches and then another wooden lining with a layer of heavy paper. It is 16 feet square and does not in any way resemble one of the new silos now in general use. It is now being used as a straw barn.—R. A. KENNEDY, Wisconsin.

INTERIOR OF MR. WEEKS' SILO

From Calves to Cows in a Calf Club

J. P. EVES, IOWA

THE distribution of seventeen Holstein heifers in Fayette County on May 29, 1919, marked the organization of the first pure-bred dairy heifer club in Iowa. The county farm bureau and the county Holstein breeders' association co-operated with the Iowa State Dairy Association in its organization. Great care had been taken to secure as members only those boys and girls who could be relied upon to properly feed and grow out these heifers, which were from six to ten months of age at the time.

The calves were scored with the understanding that they would be scored again at the county fair in August, the farm bureau announcing the offer of a silver loving cup to the boy or girl making the greatest improvement on the score; the Fayette County Fair Association cooperating by offering an exceptionally strong premium list for club heifers, and providing a building for lodging and headquarters for the members during fair week. All plans worked out to make the exhibit one of the strongest drawing cards of the fair. The members had been given suggestions on feeding and fitting for the show at the time of a club tour a few weeks previous.

On May 26, 1920, the heifers were brought in to a show and sale which was to bring the club to a close. The heifers had been well cared for during the winter and showed splendid growth. Assistance was given in clipping each heifer previous to selling. It was arranged previously that all members who bought back their heifers should be carried along in an advance club. The interest and enthusiasm of the members were such that they were forced to buy back their heifers at a price that would have given them a handsome profit, in order to be able to continue in the club. All but three head were repurchased. Following the sale A. Hanson, Holstein breeder and banker of Oelwein, Ia., made the statement that he would give two $50 prizes; one to the boy or girl who would make the best seven-day record on his or her heifer, at the age of junior two-year-old, and the same for the one whose heifer would be senior two years old at the time of freshening.

It was unfortunate that all of the members were not so situated to be able to compete for these prizes. Many found it next to impossible for them to get testers when their heifers freshened. The two Stewart boys, Mike and Bob, ages 13 and 10 years, however, had the advantage that their father was doing other testing at the same time. They fitted their heifers for test, fed them during the test, milked them four times a day, with the result that records were made which I very seriously doubt

LINED UP AT THE 1920 SHOW AND SALE

have ever been duplicated on calf club heifers at this age. Mike's heifer, Miss Eliza Highland Johanna The Third, freshened at the age of two years and two months, and made a record of 17.2 pounds of butter from 326 pounds of milk, an average of nearly 47 pounds of milk per day. Bob's heifer, Miss Diana Butterboy Beets, freshened at the age of two years and ten months, produced 21 pounds of butter from 405 pounds of milk, an average of 58 pounds of milk per day. Incidentally the two club heifers dropped very fine heifer calves.

The Holstein heifer club work in Fayette County is continuing in a splendid way. Last June sixteen more heifers between six and ten months of age were distributed among sixteen new members. Plans are being developed now whereby a third club will be organized and calves distributed within the next two months.

Fayette County is making an exceptional success of the Holstein heifer club for a number of reasons. Paul Stewart, president of the Fayette County Farm Bureau, is one of Iowa's most successful breeders of Holstein cattle. He is an enthusiastic believer in club work and the importance of interesting the boys and girls in good pure-bred dairy heifers. All the breeders of the county are solidly behind the club work, offering free services of their herd bulls to all club members.

The real success of the work, however, can be attributed to County Agent Clyde Combs, who follows up the work and keeps in touch with the members during the year. I predict that these clubs will do much to establish Fayette County as one of the leading Holstein counties in Iowa. A number of new breeders have been started simply by the parents of club members becoming so interested in the heifers that they are purchasing pure-breds additional to the heifers owned by the children.

BOB STEWART AND MISS DIANA BUTTERBOY BEETS WHICH HE HAS OWNED SINCE 1919

Seeing the Agricultural College Work

T. R. DANIELS, WISCONSIN

ONCE in a college generation, the University of Wisconsin holds an exposition in order to present in popular form a few samples of what science has contributed to agriculture and industry.

Such an exposition was held at Madison in April. Each of the eighteen departments of the Agricultural College was represented by a booth. By means of charts, soils, living plants, and animals, machinery, and expert demonstrators the work of the experiment station was visualized to the people of the state. Thousands of farmers attended the exposition to see the progress that had been in farming.

Maintain Soil Fertility

The soil is the greatest resource that the farmer has. It is fitting that the College of Agriculture should study the best methods of keeping up its fertility. The soil booth was an object lesson on the value of fertilizers to the farmer. The demonstration showed that the soil was not just a conglommeration of dirt; but when the soil is separated into the elements that make it up, a cubic foot of silt loam may contain 40 pounds of oxygen gas, 29 pounds of silicon, aluminum equivalent to a bar weighing 3.5 pounds, a 2-pound piece of iron, and a good sized chunk of carbon. The elements that the plant uses are present in very small quantities. A cubic foot contains .14 pound of nitrogen, .07 pound of phosphorus, and 1.5 pound of potassium.

Living corn plants were used to show how corn on peat soils responded to potash and phosphorus treatment.

Charts containing figures showed where oats grown on the University hill farm without fertilizer yielded 71.1 bus. Where phosphates were added, the yield was increased to 83 bus. an acre. The addition of a complete fertilizer increased the yield to 93.8 bus.

The benefits of liming the soil were visualized to the farmers by other plots of green plants.

Raise Pedigree Seed

Wisconsin grows more pure-bred seed grains than all the other states combined. This record was made possible by the untiring work of R. A. Moore, of the Agronomy Department. The agronomy booth vividly represented the enormous value of the pedigree seed trade. A continuous river of pure-bred corn, oats, wheat, rye, and barley was made to flow from Wisconsin to her numerous markets. Small colored electric lights flashed at frequent intervals to show the destination of the seeds. Wisconsin pedigree seeds are used in nearly every state and in most foreign countries.

One of Wisconsin's newest crops is the hemp crop. The industry has now reached the million dollar mark.

Animal Husbandry

Closely associated with plant production is the raising of farm animals. The animals were represented by popular types of dairy cattle, horses, sheep, swine, and baby beeves.

The dairy department and the cow testing department were each represented by a booth. The display showed why Wisconsin is the foremost dairy state. Seven machines for the testing of dairy products were on display. These machines were all invented by Wisconsin men. The Babcock milk test has revolutionized the dairy industry. The Farrington alkaline tablet acidity test is a simple way for butter and cheese makers to test the sourness of milk and cream. The Hart casein test makes it possible to tell how much casein there is in cheese. Butter must not contain over 16% water, so Mr. Farrington invented the butter moisture test. By means

TOP PRICES FOR MARKET MILK

Philadelphia Pays Producer Well and Sells the Consumer His Quart Cheap Without Strikes or Even "Rumors" of Milk Wars

MILK producers' associations the country over turn to the "City of Brotherly Love" for a lesson in the peaceable handling of market milk difficulties. The record of the Inter-state Milk Producers' Association with headquarters at Philadelphia is notable proof that milk can be marketed successfully without "war" and with very little of "rumors" of war.

Wherever milk producers meet to discuss their selling problems, the Keystone metropolis is held up as an example to be emulated. "In Philadelphia," it is commonly said, "producers and distributors work together without friction. The price to the farmer is high, the dealer's margin is small, and the cost to the consumer, low." A closer acquaintance with conditions than most of these commentators have, reveals the fact that, though selling difficulties are not unknown in the Inter-state Milk Producers' Association, its officers have been strikingly far-sighted in their policies and broad minded in their relations with the distributors and consumers.

The Inter-state Milk Producers' Association was organized in 1916 as a successor to the Milk Shippers' Union which has existed for seventeen years. At the meetings of this old organization the members and officers talked, settled upon a price, and went home—having no facilities for forcing the market in line with the price agreed upon; or for improving production or suiting it to the market. Since 1916 the Inter-state Association has grown to a membership of 12,500; 9,000 in Pennsylvania, 1,400 in Maryland, 1,400 in New Jersey, and 700 in Delaware. It has 217 local organizations and sells to 780 dealers. Besides the milk supply of Philadelphia, it sells principally to Harrisburg, Reading, Allentown, West Chester, Wilmington, Altoona, and Camden and Trenton. The association is financed by a one-cent deduction for each 100 lbs. of milk, which is made by the dealers to whom the farmer sells.

The first real strength of the producers' organization came with the appointment and subsequent investigations of the Tri-state Milk Commission, of which Dr. Clyde L. King was chairman. The first findings of this commission gave the producers' case so favorable publicity that the dealers discredited in the price controversy asked for an investigation. Later Dr. King was appointed milk expert for the Food Administration of Pennsylvania. At first the dealers refused to confer with the farmers but later joined with them in asking for Dr. King's appointment as arbitrator in milk price discussions, a position which he now fills in Philadelphia, Pittsburg, and Baltimore.

Especially fortunate for the producers from the beginning of the association was the election of F. P. Willits as president and the appointment of R. W. Balderston as secretary, which positions they have held continuously to the present time. Thoroughly conversant with the factors controlling milk prices, they have represented the farmer in the best possible manner. Perhaps the strength of this producer organization is well indicated by its ability to maintain an 8-cent f. o. b. Philadelphia price this season when milk in carload lots from outside points has been offered at prices materially lower.

OFFICERS AND EXECUTIVES INTER-STATE MILK PRODUCERS' ASSOCIATION

Sitting, left to right—H. D. Allebach, vice-president; Frank P. Willits, president; R. W. Balderston, secretary. Standing—N. F. Gotshall, field man; A. B. Waddington, R. F. Brinton. Members executive committee—Fred. Shangle, treasurer; A. A. Miller, editor Milk Producers' Review.

Stabilizing Prices

A study of milk prices for the ten-year period ending in 1916 shows that producers in the Philadelphia district received a slightly lower price than those in the New York, Chicago, and Pittsburg districts in January and December and a higher price in May, June, and July. Inasmuch as more milk is sold during the summer months the Philadelphia market for the year averaged with or above that in other cities. The Inter-state Milk Producers' Association, with the representatives of other milk interests, have agreed that a stabilization of prices throughout the year is beneficial to the industry. In order that stabilizing prices, by holding down values in times of shortage and keeping them up somewhat in times of surplus, might not tend to encourage summer dairying at the expense of winter dairies, a surplus plan has been put in use.

The Surplus Plan

In October, 1919, an agreement was entered into which divided the product into fluid milk and manufacturing milk and defined what should be called surplus. The quantity of milk delivered by a producer in October, November, and December, 1919, was taken as the basic quantity to be sold throughout the year except in May, June, and July, when it was agreed he could deliver 110% of that quantity at market milk prices, and in August, 105%. All milk over that quantity, which averages 12 to 15% of the total production, was to be sold on the basis of its butterfat at 120% of the price of New York 92-score butter. For example, if a producer marketed an average of 2000 lbs. of milk daily throughout the three months, October, November, and December, 1919, and his milk totalled 3000 lbs. in the following June, he could sell 110% of 2000 lbs. or 2200 lbs. at fluid prices and the remaining 800 lbs. at manufacturing prices. If butter averaged 50 cents for the month he would receive 120 per cent of $.50 or $.60 per pound for surplus fat or $2.40 per hundred pounds of 4 per cent milk for the 800 lbs.

Under this agreement the price announced monthly as "subject to change whenever warranted by market conditions" is continued until changed in a conference which may be called by distributors, manufacturers, or producers. As an illustration, the price list published for February, 1921, and which is in operation through May specifies that 3.5 per cent market milk f. o. b. Philadelphia is worth $3.48 per 100 lbs. or 7.6 cents per quart. The price on surplus is 5.6 cents per quart. Knowing the quantity of milk he can sell as fluid, the producer easily calculates his return from the milk he sells. A charge of 23 cents per 100 lbs. is allowed for running the country receiving station. This, in addition to the freight charges, is deducted from the f. o. b. Philadelphia price.

A comparison of Philadelphia milk prices with those in Chicago and New York is illuminating. The 1919 average for 3.5 per cent milk in Philadelphia was $3.88 per hundred and in Chicago and New York, $3.60 and $3.71 respectively. In 1920, New York led in the price secured for the producer, the year's average being $4.27 while $4.04 was paid in Philadelphia and $3.85 in Chicago.

Low Margin for Distribution

Philadelphia dealers enjoy a reputation for economical distribution which rivals that of the producers for "peaceable and successful selling of milk". They paid more for milk in 1919 than either Chicago or New York dealers and yet undersold them, charging an average of 13.59 cents per bottled quart when Chicago dealers taxed the consumer 14.16 cents and the New York distributors collected 16.17 cents. In 1920 the Philadelphia retail price was lower than in the other two cities, being 14.25 cents against 14.8 cents in Chicago and 16.5 cents in New York. Considering that the Philadelphia price to the producer is high, the narrowness of the margin for distribution is striking. During the present season when the producer price has been about 8 cents, the retail cost has been 13, leaving a margin of about 5.

There are a number of reasons advanced in explanation of the fact that the milk man of the Quaker metropolis carries milk so cheaply from the producer to the back porches of the city. In the first place the city has been largely apportioned so that the different retailing companies cover their routes with a minimum of overlapping. Also, they carry large loads, each wagon taking 400 to 450 quarts at a trip as compared with 300 or even 200 in some cities. The narrow margin has given the bulk of the city's milk business to five large dealers, which leads to greater efficiency of distribution than would be possible with a large number, each handling a small quantity. Since the Inter-state Association came into operation the number of dealers in Philadelphia has been reduced from 700 to less than 300 and President Willits stated at the American Farm Bureau Federation dairy conference in Chicago, May 3, that the number will likely be still further reduced.

Advertising Milk

Conspicuous in the activities of the Inter-state Milk Producers' Association is its interest in work other than that directly involved in selling milk. It has an important part in dairy council advertising of dairy products, sharing offices with the Inter-state Dairy Council and contributing liberally to its support. Beginning with December, 1920, the producers authorized a deduction of one cent from the price quoted for 100 lbs. of milk, for advertising purposes. A $100,000 educational campaign is now underway, financed half and half by producers and distributors. Already results have been secured in increased consumption which the association hopes will cut down the percentage of manufactured milk to even less than the present 12 to 15 per cent.

The Inter-state Association also serves its members by pointing out methods of bettering the market qualities of their product. As an example, as early as March a campaign was begun this year to encourage the cooling of milk.

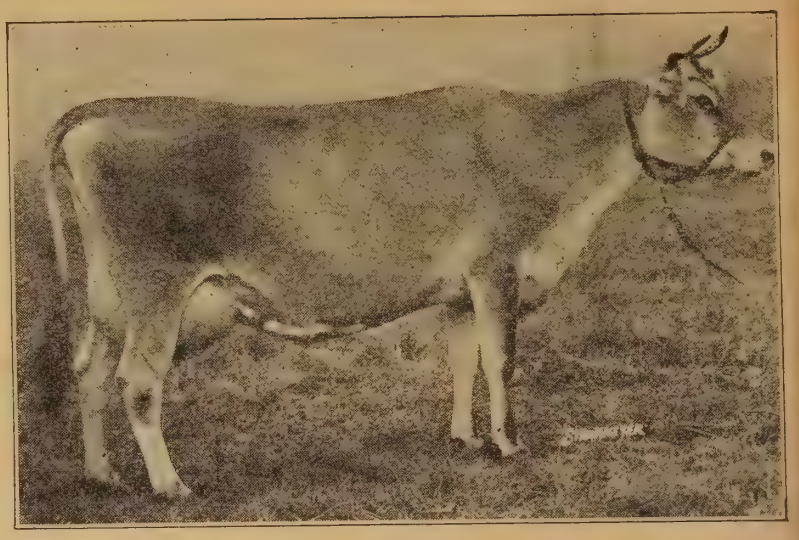
Thus, the Inter-state Milk Producers' Association—which has never called a strike—serves its members: It sells milk by satisfying the public and the distributors in conference; it equalizes prices throughout the year so far as possible; it defines market milk and manufacturing milk, and makes separate prices for the two; and it engages in any other work besides selling which will improve market milk conditions. Through its activities it is a strong factor in making Philadelphia a city where "producers and distributors work together without friction, where the price to the farmer is high, the dealers' margin small, and the cost to the consumer low".

Southwest Alfalfa Injured

SANDERS SOSLAND, MISSOURI

SOME concern has recently developed among dairymen over the reports of extensive damage to the growing alfalfa crop in the Southwest and West as a result of the recent freezing temperatures and infestation by pea aphis and green bugs. Here and there consumers have been influenced to accumulate stocks of alfalfa for late spring and early summer needs by the discouraging crop advices from the more important producing regions, including Kansas, Oklahoma, and portions of Arizona and New Mexico. In other instances, the dairy trade has been placed somewhat in the dark as to the probable time for buying. Many inquiries have been received by dealers on the large Middle West markets from dairymen seeking advice as to whether continued delay in buying is advisable in view of the unfavorable turn in the crop situation.

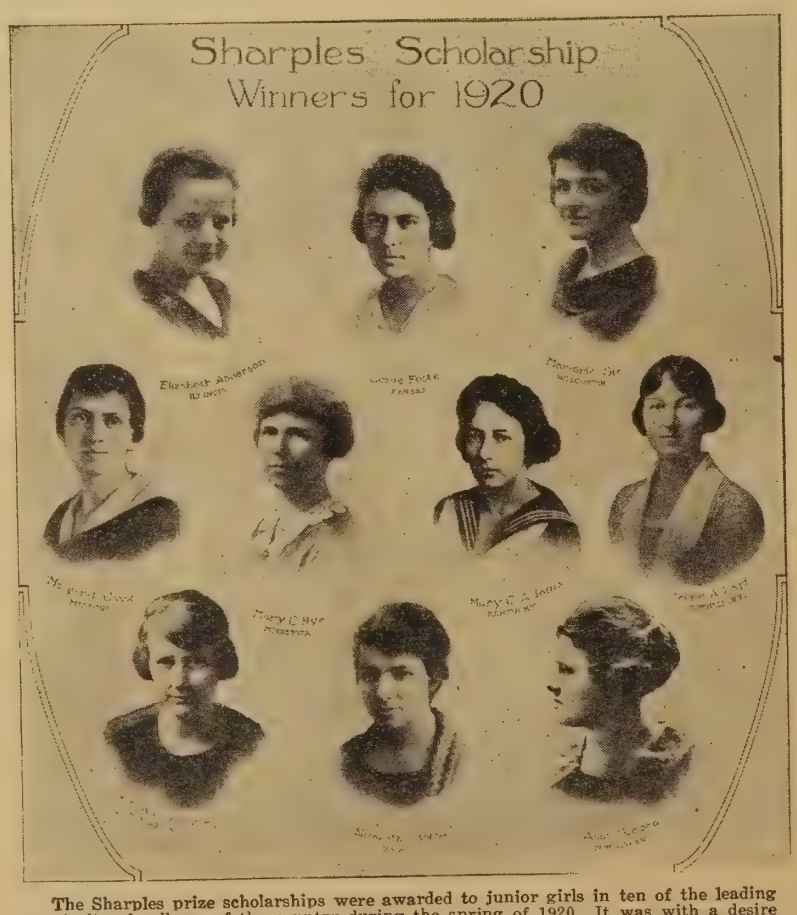
Marketings of the new crop alfalfa from southwestern states are expected to begin four to six weeks later than normal this season as a result of the damage to the plant. In many sections of Kansas and Oklahoma, entire fields have been mown down, the plant having been killed by the freeze. Advices from producing sections indicate that practically no first cutting will be gathered in Kansas or Oklahoma. Even the growing plant in the far southwestern states, including New Mexico and Arizona, which ordinarily is cut the latter half of April and often available in commercial channels around the opening of May, has been stunted in growth and will be late in moving this year. No important movement of new crop alfalfa is expected out of New Mexico until the middle of May or possibly as late as the opening of June, while the trade in close touch with the crop situation in Oklahoma and Kansas manifests doubt as to whether important marketings can be expected before the middle of June. In Kansas City, the largest alfalfa market, the first new alfalfa is usually received late in April or early in May. The movement from Nebraska also will be somewhat later than normal, though the plant there was not far enough advanced to be damaged materially by freezing temperatures during the early spring.



While serious damage has been suffered by the growing alfalfa plant in the Southwest, the market for the legume has not in any way reflected the discouraging crop situation. Nor is it probable that the trade will feel the effect of the comparatively heavy loss in tonnage of the first cutting during the remainder of the spring and probably well into the summer season. Under ordinary conditions, material damage to the crop and delay of four to six weeks in the movement would be reflected in a rather strained market. However, demand for alfalfa is of such an insignificant volume and stocks of old hay still in the hands of producers are of such a large quantity that the trade is not in a position to reflect bullishly the disappointing crop. The surplus stocks of alfalfa hay in Colorado and other western states, including Idaho, Wyoming, Montana and surrounding territory, are probably the largest on record for this period of the year. This more than offsets the loss in the tonnage of the first crop.

Despite the heavy holdings of alfalfa in the hands of western producers, the movement into commercial channels is extremely light, practically the smallest on record for the late spring season. The claim of producers is that they cannot afford to bale and haul their hay to loading stations on the basis of the prices being quoted. For this reason, more or less doubt prevails as to whether any material enlargement in the marketings can be expected during the remainder of the old crop year.

A new development which demands consideration of the alfalfa trade is the recent hay freight reduction of 7½ cents per 100 pounds or $1.50 a ton from Colorado common points to Kansas City, the Mississippi River, and Chicago authorized by the Interstate Commerce Commission. This is the first reduction in forage rates from the Colorado territory since the 35 per cent advance last August. Action of the carriers in reducing rates is naturally bearish on the market for alfalfa, tending to enlarge the movement of the legume from the producing sections of the West into the Middle West and East and South. Excessively high freight rates have been the most serious restricting influence in the loading of hay in the West, and, while the reduction is not sharp, it is sufficient to make for a material increase in the marketings. A further sharp reduction in freight tariffs is needed before alfalfa and other varieties of hay can move from distant points of production to consumptive channels on a normal scale.



In a measure, the demand for alfalfa is being stimulated by the reduction in the rate schedule, but it is very improbable that the demand will broaden relatively more than the movement. Buying power of the consuming trade is remarkably light, and before buying of a generous volume can develop, observers of the trade recognize that the delivered cost of alfalfa must decline to more nearly a natural parity with bran and shorts, the coarse grains and other feedstuffs. And the "wonder plant" must undergo a radical readjustment in price before such a parity is witnessed. Another of the discouraging factors in connection with the demand situation is the serious position of the cotton belt, one of the most important buying outlets. Disappointingly low cotton prices and the resulting serious credit strain have forced a sharp curtailment in the consumption of hay, as well as other feeds. In this connection, it is significant to note that bankers in many sections of the South are advising their customers that after July 1 no money will be loaned for the purchase of feeds of any kind, making a strong effort presumably to force home production of feeds instead of the single crop, cotton. If the southern bankers are successful, alfalfa and other feed markets will feel further the restricted demand from the cotton belt.

Choice alfalfa hay on the Kansas City market is bringing around $23 to $24 a ton, with some quotations as high as $27 a ton, but these prices are deceptive in view of the insignificant movement. With a normal run of hay, the market would doubtless undergo a sharp readjustment. Dealers generally expect new crop alfalfa to sell around $12 to $14 a ton on the early movement in Oklahoma, basis loading stations, and about $15 in New Mexico. Late in June prices are expected to fall to around $10 low in Kansas and Oklahoma, particularly if weather conditions are favorable until that time.

JAP'S MERTHA LASS, JERSEY COW BRED BY MERIDALE FARMS, NEW YORK, AND SOLD IN THE FARM'S FIRST ANNUAL SALE TO T. S. COOPER, PENNSYLVANIA, FOR THE TOP PRICE OF $6,600

She has lately completed a record of 16.523 lbs. milk, 867.68 lbs. fat and is the fifth daughter of The Imported Jap to make enough fat to exceed 1,000 lbs. butter.

The Sharples prize scholarships were awarded to junior girls in ten of the leading agricultural colleges of the country during the spring of 1920. It was with a desire of encouraging young women to take a more active part in the development of the dairy industry that Mr. P. M. Sharples made possible these scholarships. Each scholarship amounted to $500 and the conditions imposed were taken care of by faculty committees in each of the institutions, the only provision being that the scholarship would be awarded to a young lady in the college who would take special work along dairy educational lines during her senior year and agree to devote at least one year following graduation to public service work.

Upper row, left to right: Elizabeth Anderson, Illinois; Conie Foote, Kansas; Marjorie Six, Wisconsin. Middle row: Margaret Cassel, Missouri; Mary C. Nye, Minnesota; Mary C. Adams, Kentucky; Irene A. Zapf, New York. Lower row: Verna L. Weaver, Indiana; Elizabeth Storm, Iowa; Anna Morgan, Pennsylvania.

Vermont Butter Scoring for 19

The first of the monthly Vermo educational butter scorings wh will be conducted throughout the ye was held April 14 at the Lamo Valley Creamery. It was a big d for the buttermakers, some who tended the scoring coming fr creameries at a distance of o fifty miles. Buttermakers, cream managers, and other representati from about twenty creameries w present at the contest to see the b ter from their own factories sco for quality and note the compari with butter from other plants.

The Lamoille Valley Creame which is the largest butter manuf turer in the New England Sta making more than one million pou of butter annually, displayed a lo co-operative spirit and spared no pense in entertaining their gue Mr. B. C. Jennings, president of creamery, obtained Mr. Clifton Lea erd of the W. H. Learnerd & Co. b ter dealers in Boston to assist in ju ing the butter and to give the butt makers first hand information as the quality of butter that best s the Boston market. In a brief talk about 75 people present, Mr. Learn laid especial emphasis upon the imp tance of the buttermakers scor their own butter before it is ship to the dealers and in case there sho be a lot off in flavor, the shipm should be so marked that the dea can handle such butter through a ferent channel.

Mr. V. R. Jones, Dairy Manuf turing Specialist, briefly outlined main features of holding most of butter scorings at the creameries that the buttermakers have the portunity of meeting other but makers in a social way and study the methods used in judging butte well as obtaining the criticisms the judges at the time the butte scored. Mr. Jones pointed out from 70 to 75% of all the milk cream handled at all the factories Vermont was made into manufactu products of which about one-hal made into butter. A high quality milk and cream is essential in mak the highest quality butter, and he

vised that milk and cream be graded and paid for on a quality basis. There should be a premium paid for first grade fat of 5 to 10 cents per pound.

Twenty-seven creamery and two farm dairy samples of butter were entered. Four creamery samples did not comply with fat or moisture standards and are not included in the averages given.

The average commercial score on 23 creamery samples was 90.35; composition score, 94.36; and the average combined score was 91.69. The average composition of these samples was: fat 82.76 per cent, water 14.32 per cent, salt 1.92 per cent, and curd 1 per cent. The butter in general was uniform in color and no samples were scored off for mottles. The chief criticism on flavor was the lack of a clean and pleasant aroma necessary to high scoring butter. No samples showed metallic or fishy flavors. A list of all samples scoring over 90 is given below:

Creamery Samples

Creamery	Score
Mt. Mansfield	93.73
Lamoille Valley	93.59
Chelsea (C. M. Story)	93.40
White River Valley	93.25
Milton Co-op. Co.	93.16
Marshfield (C. Lily)	92.66
Jersey Star	92.64
Green Mt.	92.49
Missisquoi Valley	92.39
Strafford	92.29
Lyndonville Cry. Association	92.25
Gulf Road	91.97
Elgin Springs	91.83
Caspian Lake	91.66
Gold Brook	91.40
Granite City	91.33
Mad River Valley	90.81
Deerfield Valley	90.77

Vermont. H. B. ELLENBERGER.

Ayrshire Association Loses Two Prominent Members

In the death of H. R. C. Watson of Vermont and J. Henry Meyer of California, the Ayrshire Breeders' Association has lost two of its prominent members.

Mr. Watson is the last of the charter members of the Ayrshire Breeders' Association. He was a pioneer in milk record work, and owned the famous cow, Duchess of Smithfield, whose production of 10,000 lbs. of milk in a year was given much publicity about 1880.

Mr. Meyer owned Elkhorn Farm in California, where he has developed a herd whose foundation stock was secured from Willowmoor Farm, Highland Farm, and from Canadian herds. Elkhorn Ayrshires are among the leaders on the Pacific Coast.

Thirteenth Silver Medal Bull

Gedney Farm Girl's Oxford, the thirteenth silver medal Jersey bull, is the second sire of this breed to have this honor from the Quechee Farm of Vermont. Thirty-three of his daughters on Register of Merit test have finished 45 records, which average 8,613 lbs. milk, 437 lbs. fat.

This bull was a consistent winner on the Island of Jersey before imported, and his get in this country have been show ring winners. Minerva of Belleview 3rd, by this silver medal bull, was grand champion cow at the Vermont State Fair for three consecutive years.

To Improve Indiana's State Farms

J. C. ALLEN, INDIANA

A BIG step toward putting the farms connected with the various penal, correctional, and benevolent institutions in Indiana on a better basis has been taken by Governor Warren T. McCray by calling a conference of superintendents and farm managers of all the institutions at the Indiana State Penal Farm with representatives of Purdue University.

"We want to increase the production of the farms, if it is possible, by putting them on a more efficient basis and make them do all they can in cutting down the maintenance costs of these various institutions," said Governor McCray in speaking at the meeting. The governor pointed out that the state itself is one of the biggest, if not the biggest, farmer in the state, having more than 11,000 acres scattered in a number of counties for the support of the institutions represented at the conference.

The meeting resolved itself into a round table discussion with the farm managers, gardeners, dairymen, swine men, and others from the institutions giving their experiences and receiving suggestions on how to improve this practice or that one from Director G. I. Christie and members of the staff of the Agricultural Experiment Station.

As a result, several of the men made plans for building up of dairy herds, improving their methods of gardening and live stock raising, and putting into practice various systems used in one or more of the institutions. Dehydration of food instead of canning was one of the important topics brought out. This system is being used successfully by the Indiana Boys' School and a similar meeting was arranged for next October at this institution. Governor McCray states that such conferences will be held twice a year in Indiana during his administration.

Governor W. T. McCray, superintendents and farm managers of the various state institutions, and representatives from Purdue Agricultural Experiment Station inspecting the dairy herd at the Indiana State Penal Farm. The object was to gather ideas and secure methods that will be helpful in the management of dairy herds at the other state institutions.

"The milker has always been ready to do its duty at milking time without any grudge. It has done its work well, milked clean and absolutely kept up the milk flow." —WILLIAM GRIEBE.

A Hired Man That Milks Thoroughly and Satisfactorily

PERFECTION is the hired man that milks your cows thoroughly and satisfactorily. That means, good milk flow, uniform milking, and clean milking at all times.

That's the kind of milking you want twice a day every milking day of the year. Why bother with hand milking and all its drudgery. Let Perfection solve your milking problems.

Perfection will milk your most valuable cows thoroughly and to your entire satisfaction.

It uses the same gentle action as the calf, a gentle suction followed by a *downward* squeeze followed by a period of rest. That is why cows like the Perfection and give their milk down freely.

It's an easy task for one man to thoroughly milk 24 cows in an hour's time with the Perfection. This is your opportunity to increase your herd or to milk the same herd with less labor and always get a thorough, satisfactory job of milking.

Find Out More About the Perfection

Write and let us send you a free copy of "What the Dairyman Wants to Know." It answers all milking machine questions. We'll also send you a list of Perfection owners' names and addresses near you.

Why Milk By Hand? Perfection milks more thoroughly.

Ruberoid Unit Shingles For the Roofs of Farm Homes

Ruberoid Unit Shingles meet every requirement of the most critical home builders. Careful selection of raw materials, coupled with strict technical supervision over every process of manufacture, assures for them the same high quality standard which has gained for Ruberoid Roll Roofing its enviable reputation maintained during the past twenty years.

Ruberoid Unit Shingles are particularly adapted for use on the roofs of farm homes. A distinctive texture and a pleasing color are imparted to the crushed natural slate finish in rich Indian red or cool sage green. They form a permanent, highly fire-retardant roof covering—and one which adds much to the beauty of the house.

Before you build your new home or re-roof your present one, be sure to call on the Ruberoid Dealer near you. He will be glad to show you samples of Ruberoid Unit Shingles and discuss costs and construction with you.

Association Notes

St. Louis County, Missouri:—Pure-bred Holstein bulls and one or more silos are being used by all members. A calf club composed of over 70 members has been formed in St. Charles County, which is in connection with the St. Louis County Association. In April market milk sold for $3.25 per cwt. and certified milk for $6. The creamery paid 48c per pound for fat. Milk retailed for 15c per quart and butter for 55c per pound. Alfalfa hay sold for $25 per ton; ensilage, $10; cottonseed meal, $42; bran, $30; linseed meal, $45; corn and cob meal, 65c per bushel; crushed oats, 62c.

First Rock Island County, Illinois:—During April, market milk testing 3 per cent sold for $2.12 to $3.29 per cwt. The creamery paid 45c per pound fat. Milk retailed for 10c to 15c per quart; butter, 45c per pound; cheese, 50c. Choice grade Guernsey milk sold for 25c per quart. Feed prices are: Prairie hay, $14 per ton; alfalfa, $24; clover, $20; silage, $6; bran, $23; cottonseed meal, $33.30; oil meal, $40; gluten, $48; corn, 60c per bushel; oats, 35c; barley, 85c.

First Kane County, Illinois:—Two pure-bred sires have replaced grades and this leaves but one scrub sire in the association. One member has installed watering cups and another is increasing the capacity of his barn. The highest herd average thus far this year was obtained this month. Market milk sold for $2.35 per cwt.

Lake County, Illinois:—One member bought a splendid bred Holstein bull calf at the Pabst sale. Another member did some seven-day work during the month and 3 cows of the 4 tested made better than 20 lbs. butter. Market milk testing 3.5 per cent sold for $2.35 per cwt.

Tri-County, Illinois:—A total of 36 unprofitable cows and three inferior herd bulls have been disposed of within the last 10 months. A new modern dairy barn is being built at the Jacksonville State Hospital. During April market milk sold for $2.54 per cwt. The creamery paid 32c per pound for fat. Milk retailed for 12c to 14c per quart; butter for 45c to 50c per pound.

Effingham County, Illinois:—Two unprofitable cows have been sold. There is but one grade bull in the association. There are six registered herds and nine tuberculin tested herds in the association. Market milk sold for $2.20 per cwt. The required test was 3.5 per cent and 4c were paid for each point above. The condensery paid $3.88 per cwt. for milk, and the creamery, 40.4c per pound for fat. Milk retailed for 14c per quart; butter, 60c per pound; cottage cheese, 20c.

Wood County No. 2, Wisconsin:—One pure-bred Brown Swiss bull and two pure-bred Holstein bulls were bought. One milker was installed, making ten in the association. Nine cows were sold for dairy use. Market milk sold for 36c per gallon. The average test required was 3.5 per cent. The condensery paid 52½c per pound for fat; the creamery, 42c to 44c; cheese factory, 53c to 56c. Milk retailed for 9c per quart; butter for 37c per pound, and cheese, 30c. Bran cost $24 per ton; corn, $25; middlings, $24; oil meal, $42.50; oats, $31; mixed hay, $12 to $18.

Unity, Wisconsin:—Market milk sold for $1.90 per cwt. Milk retailed for 10c per quart; butter for 35c per

CP BABCOCK FOUR BOTTLE MILK **Tester** PRICE EACH **$6.95**

Every dairy man needs this outfit. Points out the "boarder cow". Enables him to buy cows with his eyes open and to check up his creamery, etc. Tells him how to regulate feed to increase production. Highly recommended by U. S. Department of Agriculture, County Agents, etc.
Free with each testing machine: 4 test bottles, 1 acid measure, 1 pipette, 2 brushes, 1 bottle acid and Instruction Sheet giving complete information about testing milk and cream.

pound; cheese, 30c. Beet pulp sold for $40 per ton; cottonseed meal, $48; barley, $30; corn, $25; gluten, $48; hay, $12 to $14; silage, $8; bran, $22 to $27; oats, $29.

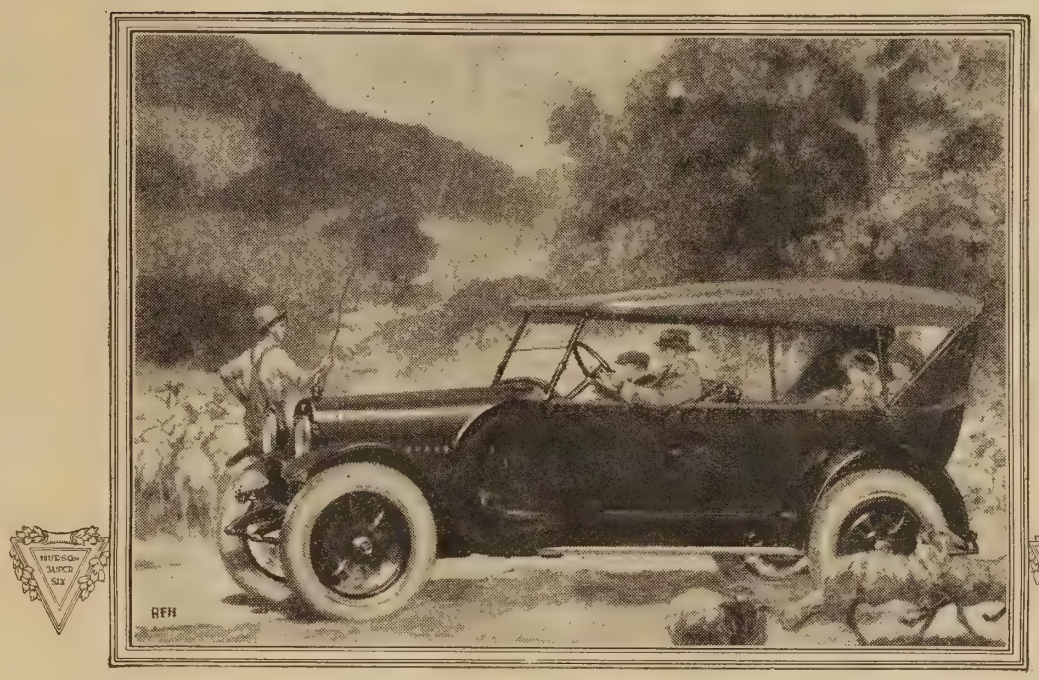
Rock Prairie, Wisconsin:—Two herds were tuberculin tested, ten head were condemned and four head were sold for beef. During April market milk testing 3.5 per cent sold for $2.35 per cwt. Milk retailed for 12c per quart, butter for 44c per pound, cheese 30c to 35c.

Fort Atkinson, Wisconsin:—During April the condensery paid $2.10 per cwt. for milk testing 3.5 per cent. Four cents were paid for each point above the required test. Milk retailed for 10c per quart. Alfalfa sold for $24 per ton; clover hay, $20; marsh hay, $12; silage, $6; corn, $20 to $23; bran, $26 to $30; brewers grains, $42; oil meal, $48; cottonseed meal, $48; oats, 50c per bushel.

Wausau—Marathon, Wisconsin:—More grain is being fed since prices have gone down and better production has been the result. The value of records was proven when one of our members sold 7 grade Holstein cows for $800; whereas, $75 is considered a very good price in this section when no records can be shown. Milk testing 4 per cent sold for $2 per cwt. Five cents were paid for each point above. The creamery paid 47c per pound for fat and the cheese factory 43c. Milk retailed for 11c to 13c per quart; butter, 40c per pound, and cheese for 28c.

North Crandon, Wisconsin:—This association has finished its first year's work. It was organized with 29 members and cheese factory employing tester two days per month. Twenty members finished the full year's test. The high cow for the year was a grade Holstein owned by Henry Peterson. She produced 11,678 lbs. milk containing 476.75 lbs. fat. Mr. J. A. Dixon's herd was highest for the year. The herd average was 7,719.8 lbs. milk, 393.71 lbs. fat valued at $488.53; feed cost, $150.60; net profit, $337.93, bringing a return of $3.17 for $1.00 expended for feed. Mr. Rasmussen was second with five cows averaging 7,014.4 lbs. milk, 337.37 lbs. fat; value, $834.40; feed cost, $442.06; net profit, $492.34; making a return of $1.88 for $1.00 expended for feed. Fifty unprofitable cows were sold to the butcher, 10 to farmers, and 4 pure-bred bulls were bought.

Juniata County, Pennsylvania:—Only one member does not use a registered bull one hundred per cent of the time but he will get one in the fall. Market milk sold for $2.75 per cwt. The condensery paid 60c per pound for fat. Milk retailed for 10c per quart; butter, 70c per pound; cheese, 40c. Silage was quoted at $6 per ton; hay, $20; corn stover, $8; corn and cob meal, $22.80; ground oats, $32.80; bran, $40; cottonseed meal, $50; oil meal, $50.



Salem County, New Jersey:—In the month of April milk sold for $3.28 per cwt. The required test was 3 per cent and 4c were paid for each point above. Hotel milk sold for 11c per quart. AA milk sold for 12c per quart and a bonus for each point over 5 per cent. Alfalfa sold for $26 to $30 per ton; clover $24 to $28; mixed hay, $18 to $25; corn and cob meal, $27; cottonseed meal, $44; linseed meal, $52; brewers grains, $43; gluten, $43; ground oats, $40; bran, $34; beet pulp, $45; corn meal, $35; silage, $8.50; molasses, $10 per barrel.

Bonner County, Idaho:—We now have 9 registered bulls and are making plans for more. We are blowing out stumps, getting ready for sunflowers. Will be putting up 20 new silos in Bonner County this year. Mr. Alverson has a son out of the only son of Duchess Skylark Ormsby at the head of his herd recently purchased from Waikiki Farm. During April market milk sold for $3.50 per cwt. The required test was 4 per cent. The creamery paid 44c per pound for fat. Milk retailed for 13c per quart; butter, 60c per pound; cheese, 40c. Bran sold for $34 per ton; oats, $42; corn, $42; barley, $46; linseed meal, $00; hay, $25; roots, $8; silage, $8. About 16 dairymen from Bonner County motored to Kootenai County on a silo excursion. After looking over various silos, they motored to Coeur d' Alene to a banquet, after which Mr. F. R. Cammack of the Idaho extension division gave a talk on silos and Mr. O. C. Miller on cow testing associations and benefits derived. As a result, Kootenai County will form a cow testing association soon and both counties are going strong for silos.

Kings County No. 1, California:—Ten boarders were sent to the butch-

(Continued on page 768)

HUDSON
Super-Six

Smoothness and Operating Ease Come First

Men everywhere, have long known the outstanding advantages Hudson gives, particularly in country driving.

Such motor users make their choice on the capacity of the car to stand hard usage, with infrequent service needs.

Hudson Meets Every Requirement

Reliability is their first demand. That answered the important factors are safe, rapid travel, with economy, comfort, and easy control. Bad weather, difficult roads and great distances to be traveled must not restrict the punctual conveyance demanded.

Inadequate cars do not survive in this sort of service; nor in the good opinion of this sort of driver. Hudson's long leadership in such service is the only answer needed as to its fitness.

Comfort, Too, Is Important

Its riding ease—the way it subdues the shocks of rough travelling mean not only freedom from fatigue to the passengers, it relieves the car from strains, saving years to its life.

When men observe the older Super-Sixes still giving smooth, dependable service after more than five years of such duty, it is hardly surprising that they place unreserved confidence in Hudson.

EDITORIAL COMMENT

MILK is the essential element in the diet of civilized peoples.—CLYDE L. KING.

SEVERAL counties in Southern Minnesota have formed a co-operative organization of the creamerymen for the purpose of standardizing and marketing their butter, buying creamery supplies, and promoting in general the interests of the creameries in these counties.

We look upon this as an important move for unless the co-operative creameries adopt a plan for standardizing their product and for marketing it in carload lots, they are likely to suffer in the future. The purchasers of butter desire a uniform product and the heaviest buyers will purchase a butter of uniform grade even though it does not score as high as lots of butter of various scores. What is needed is large production of uniformly high scoring butter in order to market it to best advantage. Not only will the price for butter be better but a material saving will be made in freight rates and other charges.

The co-operative creameries may well group themselves sectionally and then federate themselves into an organization as a whole for the purpose of producing a uniform grade of butter and marketing it co-operatively.

BONE MEAL FOR COWS

Farm animals improperly nourished are often found eating materials foreign to their rations. This is especially true of heavy milking cows for their milk production is making heavy demands upon their systems. If rations are not carefully balanced so that they will contain not only an adequate supply of protein, carbohydrates, and fats, but mineral matter as well, abnormal appetites are developed, indicating malnutrition.

Professor T. L. Haecker, who for many years was professor of animal nutrition at the Minnesota Experiment Station, kept a supply of bone meal on hand because he felt that there were periods in an animal's life when the ration needed more soluble ash than is ordinarily supplied in our common feedstuffs. When a considerable portion of the cow's ration was made up of corn he observed that there was a larger demand for soluble ash and he supplied this in the form of bone meal. It was his experience that by adding a little bone meal to the ration the abnormal appetites of the cows disappeared. It would seem, from the evidence that has been coming from various sources, that the feeder may well consider supplying at least the heavy milking cows with some mineral matter; finely ground bone meal carries the substances which the ordinary feedstuffs may lack. It must be borne in mind that milk is rich in mineral matter and in order to supply it we have often felt that the addition of bone meal or some other substance rich in these elements is advisable for heavy working dairy cows.

TAXES DIVIDE FARMS

Large estates in England are being divided into farms cultivated for profit. In commenting upon this, the Farm and Home says:

"From various parts of the country reports continue to come of historic houses changing hands or of large landed proprietors being compelled to reduce the size of their estates, owing to the increasing pressure of taxation on them. The breakup of estates often means that farmers become owners, often against their inclination. Without going into the desirability or otherwise of the change from tenancy to ownership in farming, what is now happening is the outcome of the modern idea in government in which extravagance in expenditure is regarded rather as a virtue than as a vice."

The division of these large estates that the men who till the soil may become owners of farms will be, in our opinion, of much benefit to the agriculture of England. There is a stability for nations in ownership which should be encouraged and fostered by governments. The reasons given for its division of these estates are not attractive, of course, as we appreciate when we pay our taxes. However, it may be somewhat comforting to know we are not the only nation enjoying high taxes.

Here is another statement the Farm and Home makes which indicates England has much the same problems in her agriculture as we: "The only remedy is for agriculture to organize itself in a solid phalanx from land owner to laborer, and make itself a force which cannot easily be injured. This, we are persuaded, may be done by co-operation." It is further stated that when farmers operate in separate units they are helpless but when organized upon a co-operative basis they may gain the strength and unity necessary to prevent disaster, not only to agriculture but to the nation. There is no question but that agriculture, not only of England but of this country, must be organized in order to not only serve itself but that it may help in directing effectively national affairs.

POWER OF CO-OPERATION

The strength of co-operative societies, when properly organized, is shown in the power they are wielding in Russia under the Bolshevist government. It has been reported by a representative of the Russian co-operative societies that the Bolshevist government cannot break down these enterprises. In other words, they have become stronger than that government. This is a commendation of these co-operative societies and a condemnation of the government by an arbitrary minority as now exists in Russia. It is most unfortunate for any nation when a part becomes stronger than the whole.

The movement in this country to establish co-operative manufacturing and selling enterprises for all classes of farm products, if organized upon the right basis, will become a powerful agency for improving agricultural conditions. We have faith that our government will never become of such a character as to be dominated by a bolshevist minority of radicalism or special privilege and thereby so weakened as to make these co-operative enterprises stronger and more efficient than the government itself. It is desirable that agriculture be organized upon a co-operative basis that the farmer will be able to direct his own affairs and to market his products to best advantage.

In accomplishing all of this, it will not be necessary to destroy all the agencies which are now handling farm products, for a large per cent of them fill an economic place. The only objections raised at the present time are against institutions which are performing no particular function but claim their percentage in the cost of handling farm products. It is the purpose to eliminate all useless institutions or those that charge too much for their service in order that farm products may be manufactured and marketed more economically. There is no destructive motive back of the effort upon the part of farmers in organizing agriculture upon a co-operative basis. Neither is there a desire to build an institution which is stronger than the government, but strong enough to serve agriculture well and to prevent economic losses in the handling of farm products.

WILL INCREASE PROFITS

The rapid decline in the prices of dairy products emphasizes the necessity of weeding out poor producing cows, of improving the quality of dairy products and advertising their food value. The uneconomical dairy cow not only causes a loss upon returns for feed consumed but she supplies a sufficient quantity of product which assists materially in depressing the price of dairy products. There is only one way to treat a cow of this character and that is to send her to the butcher.

The poor quality of dairy products is a large factor in decreasing consumption. When the consumer purchases butter, cheese, or milk which does not appeal to his palate, he lessens his consumption of these products. It is not overestimating facts when we state that people will eat from 10 to 50 per cent more dairy products when of high quality than if they are of poor quality. Further, good quality dairy products cultivate a taste for such foods which is an advantage to the dairy industry.

The splendid food value and importance of dairy products are not fully appreciated. But where this information is made known to the consumer a marked increase in consumption follows. Three prominent factors stand out before the dairy industry: Better dairy cows, higher quality dairy products, and advertising them that the consumer may know their food value. They should be given more attention than they have had, for they are of the greatest influence upon the dairy industry. They are the factors which dairymen and their organizations have under full control.

BETTER MARKETING

Elsewhere in this issue we publish a brief outline by Professors B. H. Hibbard and Theodore Macklin of the Wisconsin College of Agriculture for an improved system of marketing farm products. Their suggestions are sound and offer a substantial basis to those desiring to improve the system of marketing farm products.

There is a deep interest everywhere on the part of those engaged in agriculture to get their products in the hands of the consumer at less cost. This is commendable. The methods advised by some are of doubtful value, and we surmise that many plans have come from people who do not appreciate that it is a tremendous job to improve our marketing system so that an appreciable saving will be made.

A farmer recently purchased a 10-lb. roast at a local meat market, carried it to his automobile, and took it home. A woman from the city came to the market and bought a pound of beefsteak and ordered it sent to her home. This farmer holds that he should have bought his meat cheaper than the woman who ordered it delivered. He was informed of another market that made a discount when people carried their parcels. To this suggestion he said, "I do not like that market and I prefer to trade at the one from which I buy." This reply shows one of the reasons for preventing the development of what some people would term an ideal system of marketing farm products or any other kind of commodities. In short, our system of marketing various products is an outgrowth of the demand of the people. We believe certain improvements can be brought about so that the producer will get a larger share of the consumer's dollar but the opportunity for improvement is nowhere near as large as some would have us think. Personal preference and desires have a large bearing upon shaping the methods of distributing commodities. Not every person is seeking the greatest efficiency, but desires his personal tastes satisfied.

Substitute Silage Crops

As our clover is nearly all frozen out, what can I put in my silo? Can millet be used for silage? How would sunflowers do? Where should they be planted and how?

Foxboro, Wis. H. D.

Millet will make a fair grade of silage and is used for that purpose in many sections. It should be cut when the stems contain considerable moisture and before the seed commences to get hard.

Clover and timothy make an excellent silage crop, even better than clover alone. Oats and Canadian field peas are also a good substitute silage crop. These are sown at the rate of a bushel and a half each per acre, seeding the peas from 2 to 3 inches deep, depending on the character of the

soil. This crop should be cut for silage when the oats are in bloom and the pods are just beginning to form on the peas.

Sunflowers are considered to be an excellent crop for silage, but men have had varying results. In some cases the silage does not seem to have been of as high quality as in others. The best information we can get, however, indicates that silage made from sunflowers yields a larger tonnage per acre and makes a very satisfactory feed, being only slightly inferior to corn silage for feeding dairy stock. Most men state that their cattle like it quite as well as they do corn silage.

Sunflowers for silage are planted in the same manner that corn is planted. The variety most generally recommended is the Mammoth or Giant Russian, although in North Dakota there is the recommendation that the Black Beauty and White Beauty are quite satisfactory.

The amount of seed required per acre will vary according to the closeness of the rows and the nearness of the plants in the rows. When used alone, it will take from 6 to 8 lbs. of seed per acre but when seeded with corn from 3 to 5 lbs. will be sufficient. Professor Boss reports that in Minnesota they have planted sunflowers between May 15 and 25, using 16 to 20 lbs. of seed per acre with rows 36 to 42 in. apart and plants 2 to 5 inches apart in the row. The seed may be planted with the corn planter or with the regular drill with the spout stopped so as to seed in rows 36 to 42 in. apart. Where the ground is reasonably free of weeds, it will be found preferable to plant the sunflowers as closely together as when planting corn for silage. Under this system of planting, the stalks will not be inclined to grow so large or become quite so woody.

If sunflowers are to be harvested at the same time the corn is harvested, we would generally prefer to plant them two weeks later than corn. If it is expected to ensile them alone, without reference to the corn, then they may be planted at the usual time for corn.

Food Value of High and Low Testing Milk

What are the comparative values per quart of milk testing 3.5% fat and milk testing 5% fat? That is, I would like to know how much more a quart of 5% milk is worth than a quart of 3.5% milk when butterfat is worth 60c. There are many people that want the richer milk but they cannot seem to understand why the farmer ought to have a cent or two more for the better milk.

LaCrosse, Wis. E. H.

There is always difficulty in comparing nutritive values of different foods on the basis of commercial values. In the case of milk of different tests we are compelled to compare the muscle building qualities of protein with the heat, energy, and fat vitamine quality of the milk fat. The two are not alike and it is difficult to formulate any fixed rule for payment. Entirely aside from the question of food value, it is difficult to sell consumers on this idea. The palatability and attractiveness of the richer milk are, perhaps, the largest inducements in overcoming the bargaining value of the lower priced products.

In comparing the food value of milk of different tests, possibly the cheese factory method of payment most nearly represents the truth insofar as any arbitrary rule can be applied. The solids in milk other than fat increase as the fat percentage increases, but not in the same ratio, and the higher testing milk contains a somewhat larger percentage of solids not fat than the lower testing milk. For instance, in 100 lbs. of 3.5 per cent milk, there are 3.5 lbs. fat and 8.26 lbs. solids not fat, while in the 5% milk there are 5 lbs. fat and 9.17 lbs. solids not fat. In other words the 5 per cent milk contains 1.5 lbs. more fat and nearly one pound more solids not fat, or two and one-half pounds more total solids. However, it has been found that adding six-tenths per cent to the actual test of the milk will give a fairly accurate basis for paying for milk according to its cheese value.

Applying this system to milk of the tests given, we would assume, for instance, that there were 5.6 lbs. of fat in 100 lbs. of 5 per cent milk and 4.1 lbs. in 100 lbs. of 3.5 per cent milk. Multiplying these two by the average price for fat given (60c) would make 3.5 per cent milk worth $2.46 per hundred pounds and the 5 per cent milk worth $3.86, the 5 per cent milk being worth nearly 37 per cent more than the 3.5 per cent milk. As there are 46.33 quarts of milk in 100 lbs., this would mean that the 3.5 per cent milk would be worth 5.31c per quart and the 5 per cent milk would be worth 7.25c per quart.

On this basis of figuring, the consumer might well afford to pay 13½c (or, to be exact, 13.7c) per quart for milk testing 5 per cent when 3.5 per cent milk costs him 10c per quart, as the food value is 37 per cent greater. When other prices prevail for 3.5 per cent milk, merely add 37 per cent to get the value of 5 per cent milk. If 3.5 per cent milk retails for 8c, the 5 per cent milk is worth 10.96c; if the 3.5 per cent milk retails for 12c, the 5 per cent milk is worth 16.44c. Comparative prices for milk of other tests can be found by the same method described in the previous paragraph.

Another method of applying the "plus six-tenths" is to disregard the empirical valuation of butterfat and work back from the retail sale price of average testing milk. This gives the same price figures as the method previously outlined, but affords, perhaps, a more logical comparison.

Assuming that the average test of milk sold is 3.5 per cent and that it sells at retail for 10c per quart, what can the consumer afford to pay for 5 per cent milk on the basis of its food value? In working out this problem, it is necessary to find the price per hundred pounds of this grade of milk, divide by the number of pounds fat in this milk plus six-tenths, multiply by pounds fat in the higher testing milk plus six-tenths, and then reduce to the quart basis.

At ten cents per quart, 100 lbs. of 3.5 per cent would be valued at $4.633. To the 3.5 lbs. fat in this hundred pounds of milk we add the factor six tenths, making a total of 4.1. Dividing the price per hundred ($4.633) by 4.1 gives $1.13 as the value of one unit in the hundred pounds of the 3.5 per cent milk. In the 100 lbs. of 5 per cent milk there are 5 lbs. fat and adding the six-tenths factor gives a total of 5.6 units. As one unit is valued a $1.13, the 5.6 units would be valued at $1.13 times 5.6, or $6.328. This is the value of 100 lbs. of 5 per cent milk, which divided by 46.33 (the number of quarts in 100 lbs.) gives us 13.68 cents as the value per quart of 5 per cent milk when 3.5 per cent milk sells for 10 cents. On this basis of figuring the consumer can well afford to pay 3½ cents more per quart for the higher testing milk.

Still another method of comparison would be a computation on the basis of the contents of total nutrients in the same manner as "total digestible nutrients" are computed in the tables used in making rations for live stock, the fat being multiplied by 2½ to make a proper comparison with the protein and carbohydrates. On this basis there is .37 lb. total nutrients in a quart of 3.5 per cent milk, while a quart of 5 per cent milk would contain .47 lb. total nutrients or 2.7 per cent more than the lower testing milk. If the quart of 3.5 per cent milk sells for 10 cents, then the consumer would be justified in paying 2.7% more for the 5 per cent milk, or 12.7 cents per quart. Like figures for milk of different tests or different basic prices can be computed in like manner.

This last method gives consideration only to the total nutrients, and does not take into account the greater palatability of the higher testing milk and the yellow color, if Guernsey milk, that so appeals to the eye of the consumer.

Controlling Crow Damage

HOARD'S DAIRYMAN:—Answering the inquiry of "J. S." concerning control of depredation by crows:

A much more effective, simple, and safe protection than poison is coating the seed corn with coal tar. Heat about a teacupful of coal tar until it bubbles, remove to a safe distance from a flame, and thin by the addition of an equal quantity of a good grade of gasoline. Pour immediately over the seed corn and stir until every kernel is coated. A cupful of the mixture will be sufficient to treat a half bushel of corn. If the corn is still sticky after drying, stir in a small quantity of fine commercial fertilizer, ashes, or road dust. I have used this method the past three seasons and where used have lost no corn by crows even though they destroyed up to one-third of a neighbor's untreated seed. In fact, last season crows destroyed 75% of my untreated replanting where the first planting of tarred corn was unmolested. The only objection to this method is a slight difficulty in running the corn through the planter plates on account of the less-freely-flowing, sticky, tarred corn. The use of plates a size larger than used for untreated corn will compensate for this tendency.

A neighbor eliminates this difficulty and claims equally good results by substituting turpentine for the tar. Use it undiluted, about two tablespoonfuls to a half bushel of seed. Stir well to coat every kernel. The turpentine will dry easily and will be unnoticed except for odor.

I see no reason why these methods could not be successfully used in the Far West to prevent depredations from Mongolian (Chinese) pheasants.

Morrisville, N. Y. A. L. B.

Three-horse Evener

On page 539 of the issue of Hoard's Dairyman for April 15th, is found a drawing of three-horse evener to be used on a two-horse wagon. The point I do not understand is "chain or rod to center of rear axle". To turn around to the left, I fail to understand how this can be done with this rod so attached. My idea is to reinforce the offset by bolting to pole a half circle attached to the pole in such a manner as to not interfere with raising or lowering pole.

Sandusky, N. Y. R. E. C.

A three-horse offset hitch on a two-horse wagon is a makeshift at the best and will throw some side draft into the wagon and cause the pole to pull sideways, but the rod or chain extended to the rear axle will reduce this to a minimum.

Have you ever tried to pull a wagon with one horse; anchoring the evener back to the front axle with a stay chain? You will get exactly the same results at the end of the pole as by using the method he suggests.

It will obviously be difficult to turn to the left with the offset hitch offset to the left hand side and to turn to the right with the hitch turned to the right hand side. I neglected, however, to state that if the evener does swing too far forward in turning to the left, it can be stayed back to the axle with the stay chain.

The only really satisfactory way to hitch three horses to a wagon is to put in a double tongue or hitch one at the end of the pole by means of proper equalizers. F. W. DUFFEE.

Wisconsin College of Agriculture.

Sandwich Cheese

In "The Market Reporter" for April 16, 1921, is the following statement: "The new style, referred to as Sandwich cheese is becoming very popular and in certain markets is being taken by trade accustomed to buying Longhorns or Young Americas."

Will you kindly give me the complete details for making this cheese and state what the appearance, texture, number of holes, and flavor of such cheese of the highest score should be?

Belgrade, Mont. H. H.

Professor J. L. Sammis, of the Wisconsin Dairy School, has given us the following reply to this inquiry:

"The new style of cheese called Sandwich cheese is a good grade of American cheese made in the usual manner by pressing it in large blocks and after curing, cut up into 5-lb. pieces, which are then covered with tin foil and packed in boxes for the trade.

"The tin foil prevents the cheese from drying out and also this cheese reaches the consumers practically free from mold and very uniform in condition; no rind is present on the surfaces of the pieces, and after the tin foil is removed, every particle is fit for food.

"The term 'sandwich cheese' is simply a trade name applied to this style and suggests a possible use to which the cheese may be put rather than a difference in the method of manufacture. The style in which it is packed for the market, however, is a new departure and is proving quite attractive to the trade.

"I am not informed as to whether or not one or more of the features of the packing process or package is protected by patents."

In addition to Mr. Sammis' statement, we would say that there is, at the present time, being put upon the market by the Kraft people a patented cheese which, we understand, is made by grinding old cheese and then mixing and pasteurizing it, adding to it a certain quantity of butter and then placing these in special square containers or oblong containers. This type of cheese is said to be in large demand, but we understand that the process is patented and cannot be used generally.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

In March, 124 dairy herds in Oregon were on official test. Six of these were Ayrshires, 15 Guernseys, 15 Holsteins, 66 Jerseys, and 2 Shorthorns. The highest seven-day record completed during the month was made by the Holstein cow, Queen Ocean Rideau, owned by W. T. Phy. This record was 635.8 lbs. milk, 21.8 lbs. fat. This cow made 6.25 lbs. of fat in two days on semi-official test. Two other cows in the state exceeded this two-day fat production. Both were Jerseys: Birdie's Owl of MLP owned by Wm. L. Ladd, making 7.12 lbs., and Flossie May St. Mawes, owned by Albert Johnson, 6.258 lbs.

Coming Events

May 23—Missouri State Holstein Association first Annual Show of Sale Cattle at Sedalia, Mo.

June 1—American Jersey Cattle Club, annual meeting, New York City.

June 1—Holstein-Friesian Association of America, annual meeting, Syracuse, New York.

June 9—Ayrshire Breeders' Association meets in Springfield, Mass. Secretary, J. G. Watson, Brandon, Vt.

June 22-25—Tuberculosis Eradication Conference, State House, Boston.

American Guernsey Cattle Club Reports Favorable Year's Work

THE report of the past year's work of the American Guernsey Cattle Club made at its annual meeting in New York City May 11 is highly satisfying to all those interested in pure-bred dairy cattle. Secretary W. H. Caldwell, in his resume of the club's activities during his twenty-seventh year of service, voiced the optimistic opinion that "the interests of the Guernsey were never in a more promising condition than now" and predicted that "intelligent, hard, cooperative work with full faith in the future will mean a better business for the breeds and breeders."

President Robert Scoville characterized the club as a "service corporation" and called the attention of the members to the marked freedom of the Guernsey herd book and the Advanced Registry from errors and to the organization's progressive stand on important matters since its beginning. He drew attention to the service being offered members through the new extension plans being developed through the work of four territorial fieldmen.

In the election of officers James Logan Fisher of Pennsylvania was chosen president-emeritis; Mr. Scoville was re-elected for the fourth time; J. A. McSloy of Canada and Gage Tarbell of New York were made vice-presidents; and W. H. Caldwell, who has served the club since the World's Fair in 1893, was elected to begin his twenty-eighth year as secretary-treasurer. C. L. A. Whitney of New York and D. D. Tenney of Minnesota were elected to the board of directors.

A provision was adopted to permit the identification of imported animals of the breed by tattoo marks in the ear, the only previous method being by hoof brands.

H. G. Hall of Ohio was expelled from the club's membership for fraudulent registration and for changing registration papers.

The chief discussion of the meeting concerned the establishment of a "farmer's class" in Advanced Registry testing. The proposed division is for a 305-day record made in one lactation, to be started within 30 days of the cow's freshening, milkings to be made only two times a day, and the cow to carry a calf 205 days of the test period. Objection to this class was made on the claim that it will not fill the purpose for which it is intended, that of making a class open to men not able to compete in the present divisions, and that it fails to give the Guernsey cow credit for her persistency of production. A popular suggestion made was that only cows milked by their owners or by minor members of their families be accepted for entry in the class.

So much sentiment favored the formation of the class that a motion was carried to refer the question to the directors for further consideration and adoption.

There was a gain of 6.7 per cent in registrations for the past year over those in the year ending April 1, 1920. A total of 20,724 registrations was made; 7,893 bulls and 12,861 cows. There was a marked gain over the transfers two years ago though the number was slightly less than for last year; that for 1918—19 being 16,158; for 1919—20, 20,819; and for 1920—21, 19,929. Eleven bulls and 645 cows were imported last year.

The present club membership is 1,012, the new members for the year being 120. The membership makes up only 8 per cent of the number of breeders, and a campaign will be made to increase this percentage.

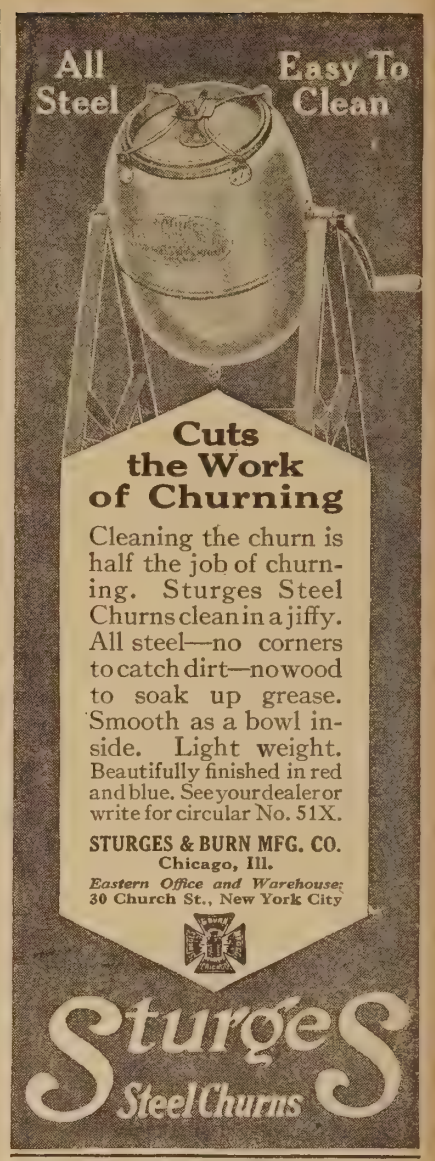
In the Advanced Register 2,336 cows are on test, a gain of 10.9 per cent over the previous year. These cows are owned by 569 breeders which is an increase of 21.8 per cent. During 1920—21 a new breed champion was developed in Countess Prue whose production was 1,103.28 lbs. fat.

During the fiscal year the club's total income was $251,200.71 and the disbursements, $250,142.24. The present assets of $127,728.71 exceed the liabilities by $51,090.38.

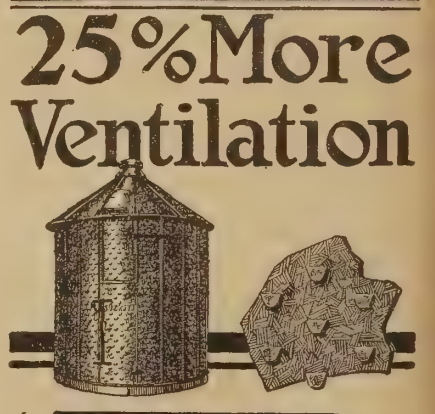
Emmadine Guernseys Make $300 Average

In the dispersal of the Emmadine Guernsey herd of New York on May 10, forty-eight animals sold for an average of $302. The top price of $2,025 was paid for Masherlette of Harbor Hill 2nd by Chilmark Farm of New York. This four-year-old cow is second in Class FF with a record of 12,602.2 lbs. milk, 634.3 lbs. fat. The second high value, $1,225, was reached by another four-year-old daughter of Glenburnie Galore, Linden Girl III. G. E. Russell of Ohio was purchaser. A third daughter of this bull went to Harbor Hill, New York, for $750. The only other sale for more than $500 was that of Emmadine Masherlette, a granddaughter of Imp. Masher's Galore to Chilmark Farm for $700. A. E. Tower of Pennsylvania paid $500 for Criterion's Buttercup of Sunnyside.

An Appeal for China



To all Wisconsin county agents and farm bureaus is going an urgent appeal from the Wisconsin Farm Bureau Federation to enlist the co-operation of farmers and dairymen in the cause of China's starving millions. Other middle western states gave hundreds of carloads of corn for Central European relief. Wisconsin, not a corn state, could not share in this praiseworthy benevolence.



But Wisconsin, rich in dairy products and knowing not the meaning of famine as a personal matter, now has the opportunity to come to the aid of our stricken friends across the Pacific. Lack of time and difficulties of shipping make it impractical to transport dairy products to China. Therefore another and very practical method has been devised.

Every Wisconsin farmer and dairyman may contribute in cash the equivalent of one morning's milking, this money to be deducted from his milk check at the end of the month.

Pledge blanks for all creameries and condenseries, furnished by the Wisconsin Committee for China Famine Fund, will be offered to these factories for the patrons in order to place their agreement upon a strictly business basis. The creameries, cheese factories, and condenseries will mail such moneys immediately to the treasurer of the committee, the Central Wisconsin Trust Company, Madison, Wis., which forwards all funds to New York, whence it is cabled to Peking. Grain is then purchased in Manchuria and rushed to the stricken areas.

DANIEL W. MEAD, Chairman,
Wis. Com., China Famine Fund.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, May 9—The fight made by Senator Hiram Johnson against the confirmation of the nomination of D. H. Blair of North Carolina to be Collector of Internal Revenue, still delays the confirmation and leads, in some quarters, to a belief that the nomination may be withdrawn, and some other appointee named by the President.

The controversy has points of interest, but to the dairy industry they are overshadowed by the continued absence of authority in the commissionership to whom an appeal can be made to settle the neutralizer butter ruling. The evidence of strong pressure to cancel the ruling continues, but no progress is being made of any kind, and even the effort to clarify the matter by congressional action is at a standstill, awaiting the action of the new commissioner.

⚜

Canadian dairy interests, represented by D'Arcy Scott, are seeking tariff concessions in Washington at this time, Mr. Scott having been here and in conference with Senate and House members for some weeks. Mr. Scott is asking for closer commercial relationships to be brought about by reciprocity arrangements and so far as butter is specifically concerned proposes that instead of the six-cent duty provided for in the pending emergency tariff, that a four-cent rate be substituted for the present two-cent rate, and promises that if this be done, or if it be authorized under later reciprocal agreements, that Canada will make a similar rate for American butter in the Canadian markets. He points to the six million pounds of Canadian butter shipped into the United States last year, and the large shipments into the eastern provinces of Canada from the United States, as the basis for his request for reciprocity.

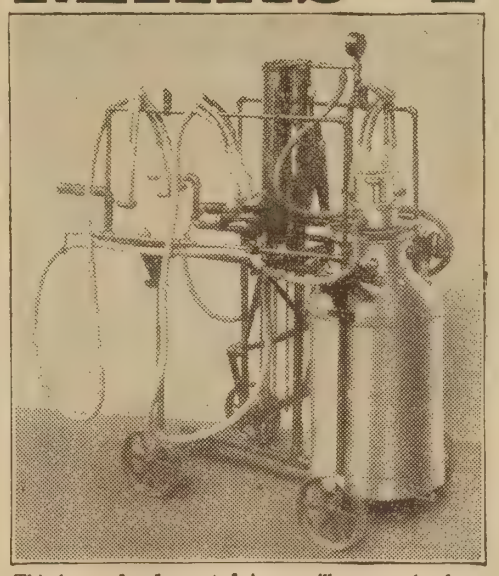
⚜

Some other legislation of general agricultural interest is being rapidly advanced. Representative Volstead took advantage of the regular calendar call of bills last Wednesday to move the final passage of the collective bargaining bill, and after a heated two-hour debate forced a final vote, and the passage of the measure with but 49 votes out of the five hundred members of the House, in opposition. It has now gone to the Senate where the Judiciary Committee has jurisdiction.

The House Committee on Agriculture reported favorably the rewritten Tincher wheat futures bill, changed to meet the suggestions made by Secretary of Agriculture Wallace. This bill restricts future trading to "contract markets" to be designated by the Secretary of Agriculture, who is also given power to supervise the rules and operation of such markets, and cancel designations. Strictly gambling operations, puts, calls, indemnities, etc., are subject to a twenty per cent tax which practically is prohibitive. There was no substantial opposition to this measure in the committee hearings.

Packer control bill hearings have advanced to the point where there is substantial agreement by farmer organization representatives and packer representatives on an amended form of the Haugen bill, or else the Williams bill—the farm bureau bill—which is very similar. Some members of the committee are still urging a more drastic bill—the McLaughlin bill—which is identical with the Norris bill in the Senate, and practically a rewrite of the old Kenyon-Anderson measure. However, even this measure has been changed in the Senate, changing the independent Commission of three, provided for in the original bill, to a single live stock commissioner to be a member of and subsidiary to the Secretary of Agriculture as the executive authority. This is the committee amendment to the bill in the Senate, upon which a favorable report was predicated last Saturday. Even thus changed, the bill contains much more drastic control provisions than the Haugen or the Williams bills in the House. The amended Norris bill is likely to pass the Senate, and the Williams bill to pass the House, and final legislation to lie somewhere between these two measures. Packer influence will seek to hold the legislation as near as possible to the Haugen or the Williams bills.

⚜



There are indications that cold storage legislation will be the next matter taken up by Chairman Haugen and the House Agricultural Committee. The two features of the Haugen bill, which has already been introduced and referred are the plain marking section, and the restriction of time in which perishable commodities may be held in storage, to 12 months. There are many representatives of the dairy industry who oppose the original provisions of the bill, as applied to butter and cheese; they assert for example, that shipment of the products in refrigerator cars should not be considered as bringing them within the rule, so that they must be labeled "Cold Storage" when offered for sale. This was the source of the opposition raised to last year's bill by the California dairy and poultry interests. Still others say that making it necessary to label good storage butter—which has deteriorated little if any during the months from May or June to December or January or even later—with the "Cold Storage" label will interpose a further handicap on butter in competition with oleo which, although made from oils of uncertain age, and worse condition before the processing process which makes them into oleo material, can be handled and sold without passing through storage sufficient to bring it within the labeling rule. There is, of course, some merit in this last contention. An answer is that instead of letting down the bars for storage butter to be sold in competition with fresh made butter, the remedy should be in more strict inspection of the plants in which and the materials of which vegetable margarines are made—not now subject to inspection at all under the Bureau of Animal Industry—and the stricter enforcement of labeling rules respecting the use of words, phrases, names, and designs or illustrations which mislead the buyers as to the real character of the nut margarines.

Pure-breds in Alabama and Arkansas

The census report for 1920 gives a total of 6,108 pure-bred dairy cattle in Alabama, consisting of 1,475 males and 4,633 females. By breeds the numbers were: 4,608 Jerseys, 1,142 Holsteins, 46 Guernseys, and 312 other breeds.

In Arkansas there is reported a total of 6,950 pure-bred dairy cattle, consisting of 1,501 males and 5,449 females. By breeds the numbers were: 4,627 Jerseys, 2,001 Holsteins, 19 Guernseys, and 303 other breeds.

Milks 4 Cows at Once

This is our hand-operated 4-cow milker; we also have a 2-cow milker ($123) on which we offer a free trial (exchangeable for 4-cow milkers), and gasoline engine and electric power milkers.

the Milking Machine Sensation of 1921

Costs Half; Does Double Work

(Twice the work of our 1920 model)

The *new* PAGE *4-cow* Milker—operated by hand—no gas engine—no electricity—one man milks 4 cows at once. Little work—quickly done—easiest of all machines to handle—easiest, by far, to clean; the most wonderful advance in milking machine manufacture.

We also have a 2 cow milker, only

$123!!

30 Days Free Trial!

In every locality in which we have no dealer, or agent or sales-manager, we will send *one* machine on 30 days' free trial and at our rock-bottom price, direct from the factory; to the first responsible farmer who asks for it. No deposit; no C. O. D. 30 days full free trial, you alone to decide. *ACT QUICK!*

After trial, if satisfactory keep the machine on our IRON CLAD Guarantee.

Costs Nothing to Install—Not a cent of installation expense—no engine, no motor, *nothing! Just* the machine for small herds. If you want power, get our electric or engine power outfits at $225 and up.

You milk right into your own ordinary milk can; no extra pails; no pipes; no pulsators; no tanks. Amazingly easy to clean.

Guaranteed to do the work.

Guaranteed to save time.

Guaranteed—the last word in sanitary milking (one creamery wrote us that the most sanitary milk came from farmers using the PAGE Milker).

And—

Guaranteed:

Action alterable to suit every cow separately. Instantly adapted to any cow according to her disposition and how easily or how hard she milks.

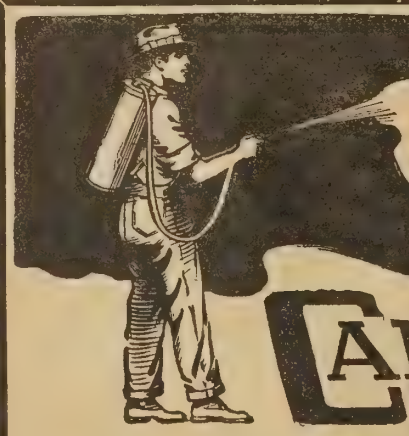
Lowe Brothers

The Colonel Fooled Me Again This Time He Did It With His Car



Friday night I saw him down in front of Perkins' hardware store with his car. We kind of joshed him a bit about how the old car was growing grey like his whiskers. With that, he smiled and said: "Just you wait."

Sunday morning—only two days later—he whizzed by with that car a beautiful jet black and shining like a bottle. Saw him at church and all I could get out of him was: "Did it myself. If you don't believe it, ask Mrs. Colonel. She got a lot of new furniture out of a can of Lowe Brothers Vernicol and I got that new car out of a can of their Automobile Color Varnish. If I can do it, so can you."

And by Jimminy, I did. If I can do it, so can you. It's sold by the best dealer in each town.

Paints

Paints and also Disinfects Dries White

CARBOLA
The Disinfecting White Paint

That Whitewashing Job

—in Poultry Houses, Stables, Pig-Pens or Cellars—

which you know you ought to do, no matter how much you dislike it, can be done quickly and easily, at a saving of time, labor and money, and any day it is convenient for you, if you will use CARBOLA instead of whitewash.

Carbola Takes the Meanness Out of the Job and Gives You Much Better Results Besides.

Carbola is a white paint and a disinfectant combined, in powder form, that is ready to use as soon as it is mixed with water—no waiting or straining. It will not spoil even after it is mixed, so you can keep it on hand ready to use when wanted or on a rainy day. You can apply Carbola with a brush or a spray pump to wood, brick, cement, stone, plasterboard, tar paper, etc., or over whitewash. It will not clog the sprayer and does not flake or scale off the way whitewash does. One gallon, which is made with a pound of the powder—costing you 10 to 12½ cents—covers 200 square feet.

Carbola is neither poisonous nor caustic—harmless to the smallest chick or to stock that licks a painted surface. It gives walls, ceilings and partitions a smooth, white finish, increases the light, improves the appearance, kills contagious disease germs and mites—makes buildings clean, sweet-smelling and sanitary. It is used and recommended by thousands of poultry, dairy and breeding farms and by many agricultural colleges and experiment stations. Give it a trial—you never will regret it.

AS A LOUSE POWDER for use on cattle, poultry, horses, hogs, dogs, etc., the dry Carbola powder will be found most satisfactory. It costs about one-third less than other brands and gives sure results. Apply it as you would any other louse powder.

Your hardware, paint, drug or seed dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express.

10 lbs. (10 gals.) $1.25 and postage **20 lbs. (20 gals.) $2.50 delivered** **50 lbs. (50 gals.) $5.00 delivered**
200 lb. bags $18.00 **Trial package and booklet 30c postpaid.**

of the ice cream over-run test, the percentage of air incorporated into ice cream can be detected. Other machines on display were the milk sediment test and the Wisconsin curd test.

Fighting Diseases

The health of animals and plants must be carefully guarded. How this was accomplished was graphically depicted by the bacteriology, veterinary science, and plant pathology booths.

In the booth of the bacteriology department, many farmers saw living germs for the first time. Thousands of them could be seen moving about. How those germs were caught on gelatin plates was demonstrated. It was but another step to show how they were introduced into bottles. In that form they are shipped to the farmers to inoculate the soil for the growth of alfalfa, soy beans, red clover, and other legumes. Each legume requires a different kind of bacteria. At a cost of $7,000, the bacteriology department was able to distribute legume bacteria to the farmers that would have cost $28,000 if purchased commercially. Charts mounted above canned goods showed how harmful bacteria may be destroyed or checked. Some methods to kill bacteria are: the use of heat, drying, excluding air, use of acids, and salts. Freezing will check their growth. The information spread by the bacteriology department has been the means of increasing the growth of legumes, extending the canning industry, and preventing disease.

By the use of mounted specimens, the veterinary science department showed how contagious diseases attack the organs of the body. How hog cholera attacks the intestines, and how tuberculosis affects the lungs was demonstrated. "Eradicate tuberculosis" was the slogan of the department. More than $9,000 worth of tuberculin was distributed, free, by the department during the past year. Through the efforts of this department, much of the tuberculosis-free area of Wisconsin was made possible.

Agricultural engineering can best be presented to the public in popular form by action. Its booth was a model barn. Model barn plans are sent out by the department to thousands of farmers every year. Necessarily, the space was too small for the operation of machinery, so the work was depicted by continuous moving pictures. Land clearing was demonstrated with the use of dynamite and the stump-puller. Organizations under the supervision of the engineering department are clearing 150,000 acres of land this summer. Moving pictures of tiling and power machinery were also flashed on the screen.

Work Together

Much has been said about keeping the young people on the farm. How the economics department is helping to solve this problem was illustrated in its booth. The original map of the social survey of Walworth County was on display. Pictures of model community buildings, community clubs, and other social activities were exhibited. The University sends out much material to aid the people of the state in their social center meetings.

The agricultural economics department visualized its work by presenting figures showing the rapid growth of farmers' co-operative organizations. Co-operative creameries, cheese factories, and shipping associations are a few of the different kinds. The Wisconsin Cheese Federation receives cheese from 120 factories that are supplied by 3,000 dairy farmers. The federation supplies 350 wholesalers who ship to 14,000 retailers that sell to 4,667,000 consumers.

Several other departments were represented by booths. The cross section of agricultural activities would not be complete without including them. The department of horticulture had a miniature model farm and orchard. An attractive home, a good garden, well pruned orchards, convenient farm buildings

SALE ANNOUNCEMENTS

May 23—Holsteins. Central Michigan Breeders' Sale at East Lansing, Mich.
May 24—Holsteins. John M. Tobin Dispersion.
May 23-24—Holsteins. Missouri State Holstein Association Show and Sale at Sedalia, Mo.

Feb. 21-22, 1922—Holsteins. Iowa Holstein-Friesian Association's Annual Sale.

were ideas that the visitor could not miss.

Economic entomology was well represented. How the department combats harmful insects and encourages the beneficial kind was demonstrated. The beekeeping industry is now tenth in importance in Wisconsin.

Armistice Queen, the hen with a year's record of 284 eggs, was exhibited by the poultry department. The pile of eggs on the one hand and the balanced ration on the other told the story.

Manufactured products were seen in the manufactured products booth. The variety is almost too numerous to mention. Canned goods, butter, cheese, hemp cloth, and dozens of other products show how manufacturing is dependent on agriculture.

Domestic Science Improves the Home

Home economics is probably the biggest single department of the Agricultural College. What would agriculture be without the home? That is the question that the Home-Ec booth brought out. Cooking, sewing, decoration, meal and wardrobe planning were a few of the activities demonstrated by that department.

One room was devoted to the economic status of the American working girl. The wardrobe of the girl with a small wage, and that of a girl with a comfortable wage was compared. The charts above the wardrobes told the story. The girl with the small income had 88 cents left at the end of the week for health and pleasure. The girl with the comfortable income had a better living and $2.50 left for health and pleasure.

Next to this room was a model rest room. It was decorated with things that could be made in the home. Many farmers' wives appreciated the efforts of the Home-Ecs to make them comfortable.

Teaching Agriculture

If the facts discovered by agricultural scientists were locked up in a vault, the people would not benefit thereby. And so it was fitting that the great disseminators of agricultural facts should each be represented by a booth: the Agricultural Extension, Agricultural Education, and Agricultural Journalism Departments.

The Agricultural Extension is the people's school. Its teachers are the county agents, home demonstrators, and boys' and girls' club leaders. How the Agricultural College reaches the people directly was explained by "live wire lines" connecting the college with the people by means of county agents and home demonstrators. Information in almost any form is given by these "live wires". The rapid growth of boys' and girls' club work was demonstrated by charts containing the records, and by actual demonstrations in the Extension booth.

Agricultural education has spread rapidly to the high schools of the state. The purpose of the Agricultural Education Booth was to show in a vivid way how the College of Agriculture functions in making agriculture practical for high school students. Most of the agricultural high schools have teachers who are university graduates.

The large mass of people get their knowledge by reading and applying what they read. Agricultural journalism is the department that furnishes that means of education. The Department of Agricultural Journalism has compiled more than 460 different bulletins, besides the circulars and articles to farm papers that it has sent out. Students of the department may be found on all the leading farm papers. When it is considered that nearly every farmer takes a paper it can readily be seen how wide is the influence of the department. Advertise, name your farm, publish farm news, are some of the progressive methods that are being urged by the department.

The entire exposition can be best characterized by the words of Gov. John J. Blaine. "It is not a cheap or showy affair in any respect. It is altogether a substantial undertaking. I was delightfully surprised at its magnitude and its purpose."

Jersey Cattle Notes

For week ending April 29:

Number of animals registered: Bulls, 252; cows, 778; total, 1,030. Number of transfers recorded: Bulls, 175; cows, 638; total, 813.

"As ye sow, so shall ye also reap."

More Money Whether You • Sell or • Feed Your Hay

THE amount of nutrition in the hay determines its grade—its value in dollars and cents. The way the hay is cured determines the amount of nutrition. Air-cured hay retains its nutrition—it is the best hay—the moisture evaporates through the stems—no loss of leaves—no sun-scorching of hay. It requires no extra tools or labor to air-cure hay. Instead of using a sweep rake or sulky, you merely use the

JOHN DEERE

DAIN SYSTEM RAKE

The Rake With the Inclined Frame

With this rake you can follow the mower closely, rake while the leaves are still active, and place the hay on clean stubble in medium-sized **loose, fluffy** windrows through which the air circulates readily, the bulk of the leaves inside and the stems outside. The hay is not sun-scorched, but is air cured—the ideal way—"Nature's Way" of curing hay.

The Dain System rake does this most successfully because it **is the rake with the inclined frame.** The frame is low at the front end and increases in height toward the rear—its capacity increases as the volume of hay increases. The frame being low at the front end and set slightly ahead of the tooth bars causes the hay to come up against the frame and pitch forward into a loose windrow, placing the leaves inside and the stems outside; most of the moisture evaporates with no loss of leaves or foliage.

Unusually big range of tooth adjustment to suit varying field conditions; **curved teeth** properly speeded to pick up all the hay gently but positively—no threshing of leaves.

In case of rain, you can, with this rake, turn the windrows upside down as often as necessary, always keeping the windrows loose.

FREE BOOKS—"John Deere Dain System Rake"—fully describes this system of air-curing hay.

"Better Farm Implements"—114 pages, illustrates and describes briefly the entire line of John Deere farm tools—a reference book you will be proud to keep on your table. Write today, address John Deere, Moline, Illinois, and ask for package DS-414.

Cow Waters Herself

with this wonderful new **Libbey Automatic Water Bowl.** Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

195 Marion Street Oshkosh, Wisconsin

Make it yourself

HERE'S a simple machine that makes cooking fuel and light from crushed stone and water. You can set it in the cellar or in an outbuilding. The only attention it requires is a little carbide about once a month.

The Colt Carbide Lighting-and-Cooking Plant is a simple mechanism for mixing carbide and water to produce fuel which gives the *hottest* flame known; and light that is the *nearest* approach to soft sunlight.

City conveniences for every farm

With a Colt plant on your place, you can make the finest fuel for hot-plates or flatirons. You can make artificial sunlight that will make your place a beacon of cheer in the gloom of moonless night, a veritable oasis of sunshine in the desert of darkness.

A Colt plant will give you added prestige and standing in your community. Your farm will be pointed out as one of the show-places of the vicinity. Your neighbors will accord you that consideration that invariably attaches to the progressive agriculturist.

A Colt plant is easily installed and the cost is very reasonable. Unless you have to pay for water, the only expense after installation will be for the carbide, which is readily obtainable in every rural comunity. An automatic shut-off precludes the possibility of waste.

Get the facts about Colt Carbide Lighting-and-Cooking Plants to-day. Find out how very little it costs to have every convenience that city-folks enjoy. A postal will bring complete information.

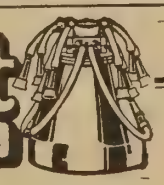
THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill



Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

DAIRY MARKET NEWS

Butter Markets Show Tendency to Steady

(Report by U. S. Bureau of Markets.)

Declining butter markets at this season of the year sometimes cause prices to drop faster than the actual supplies of butter warrant. Everyone is so intent on keeping cleaned up in order to avoid taking losses on unsold stocks that a slight increase in buying may find the market almost bare of offerings.

The wide spread in prices between Chicago and eastern markets was largely the result of an uneven distribution of receipts. Creameries shipping butter that has not been contracted for prefer to ship to the nearest market at this season even if prices are not so high.

Prices were at their low point on Friday and Saturday, and while there was considerable difference of opinion as to the future course of the market, many thought that neither present stocks on the market nor anticipated arrivals were heavy enough at the moment to force a further decline. Some looked for another little buying spurt and perhaps some recovery in prices although reports from all sections point to a continued increase in production.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending May 7, 1921, and the corresponding week a year ago were as follows:

	Week ending May 7 1921	1920
	Cents	Cents
New York	36.6	62.0
Chicago	30.9	60.2
Philadelphia	37.4	62.2
Boston	37.0	63.1
San Francisco	30.5	53.0

The receipts of butter at these markets were 11,208,973 lbs. as compared with 7,973,661 lbs. a year ago and 10,217,766 lbs. a week ago.

April Milk Prices

[From Report by U. S. Bureau of Markets]

Table I represents a comparison of the net prices received during April by producers in 3,066 local markets for fluid milk (test 3.5%) f. o. b. local shipping point or distributor's plant.

Table I—Producers' Prices by Geographic Sections

Sections	Range of prices per cwt.	Comparison of average prices 1921 Mar.	1921 Apr.	1920 Apr.
United States	$1.54–$4.65	$2.64	$2.62	$3.25

Spokane, Wash.	3.25	.14
Wheeling, W. Va.	3.14	.16
Milwaukeee, Wis.	2.25	.10

The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price paid the producer at his railway station. In certain cities the prices given apply only to that portion which is considered as the producers' average production, the surplus being handled either by the producers' associations or the dealers at somewhat lower prices. Detailed information as to the selling arrangements between producers and dealers in various markets may be secured by writing Division of Dairy Products, Bureau of Markets, Washington, D. C.

The prices given in Table II have been compiled on the comparative basis of milk testing 3.5% fat, different cities varying from 3% to 4% as the basic fat requirement on which prices are fixed. Certain markets pay on a straight price per pound fat, but most of them set a price per hundred pounds milk of a certain test and then add to or deduct from this price a certain number of cents for each one-tenth per cent in test above or below the

basic test. The most usual allowance is from 3 to 5 cents for each one-tenth per cent or "point" as usually called.

The prices paid by consumers given in Table II are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in nearly all cases is for pasteurized milk.

To reduce the prices per hundredweight, given in these tables, to either a gallon or a quart basis divide by 11.63 or 46.33 respectively.

Prices at County Shipping Stations

Prices paid during April per hundred pounds for standard grade milk (Grade B, 3.5%) at the dealers' country receiving stations or at producers' railway shipping points, as also prices f. o. b. city, are given in Table III.

Table III—April Producers' Prices Per Cwt. F. O. B. City and at Country Stations

	F. O. B. city	At country stations*
Bridgeport, Conn.		$2.21
Hartford, Conn.	$4.22	3.86

New York Butter Market

NEW YORK CITY, MAY 10:—Regular operators and speculators are now seriously considering the possible effect of Danish butter importation on the butter stored during the coming months. For some time, there has been a feeling in the market that little Danish butter would be shipped to this country in the future. That feeling was based on the suppositions that the emergency tariff bill, which bears a duty on butter of 6c, would be passed and become operative in the very near future, and that European demand would be such that Denmark would have no butter to ship to this country. Of late, there have been rumors that the Danes have found the European demand inadequate to absorb all their surplus of butter and the fact has become established that a small shipment of Danish butter is now on a boat destined for this country. That butter will reach this port about the third week of this month.

The Danes are disappointed in the demand for their butter in England. It was thought that when the British government relinquished control of the trading in butter that individual handlers of butter would purchase Danish butter freely, and such was the case at first. However, those dealers who bought large quantities of the butter have found that the butter did not move as freely as they anticipated and they were forced to curtail their purchases, thereby leaving the Danes with a large surplus of butter on their hands. The fact that the British government contracted with Australia and New Zealand for enormous quantities of butter early in the year is responsible for the slow movement of the Danish butter in England. At the present time, England has a supply of fully 50 million pounds of butter which originated in the Antipodes. Because of the surplus which they

Some of the Offerings:

A son of the world champion two-year-old for 60-, 90- and 100-day milk production. The dam, after three months, is still producing over 80 lbs. per day.

A son of King Model from Pietertje Fayne Johanna, twice over 32 lbs., with 34.54 lbs. at four years.

A yearling daughter from a 33-lb. daughter of the first 40-lb. cow.

A yearling granddaughter of the first 40-lb. cow from a 37-lb. three-year-old.

Three beautiful daughters of the famous King of the Ormsbys, one from a full sister to the former world champion first calf two-year-old.

A yearling daughter of Judge Segis from a 33-lb. dam with over 1100 lbs. of butter and 26,000 lbs. milk in a year.

A 30-lb. daughter of a 30-lb. cow and sister to the $27,000 bull.

A 33-lb. cow that produced the world champion 29-lb. two-year-old. This cow will finish with over 1000 lbs. in a year.

A full sister to the world champion 29,000-lb. four-year-old, Hollywood Lilith Bonheur, in calf to Judge Segis.

A 20-month-old son of Judge Segis from the world champion 42-lb. two-year-old, also with three records over 30 lbs. Second dam a 42-lb. cow.

A maternal sister to Cascade Fleta Johanna, the 30,000-lb. four-year-old.

Four daughters of Champion Echo Sylvia Pontiac, three of them from 30-lb. dams with 30-lb. grandams, and these three all in calf to Alcartra King Sylvia, the $50,000 son of Tilly Alcartra.

A 30-lb. two-year-old with over 200 lbs. butter and 4100 lbs. milk in 60 days. In calf to Champion Echo Sylvia Pontiac.

A bull backed by four direct generations of 700-lb. dams and seven 700-lb. cows. One of the richest May Echo bulls ever bred.

A 35-lb. cow with over 100 lbs. milk in a day. A show cow.

A 32-lb. cow with over 900 lbs. of butter in a year and in calf to the only son of Jemima Johanna of Riverside.

An 1136-lb. cow with over 24,000 lbs. in a year. Sired by Prince Aaggie Mechthilde, a son of Calamity Show Mechthilde 2d with 1108 lbs. butter and 25,598 lbs. milk in a year.

Some of the Offerings:

A 30-lb. daughter of King of the Pontiacs from a granddaughter of Tidy Abbekerk Prince.

A 32-lb. cow with 766 lbs. of milk, her dam a 40-lb. cow.

A son of a 32-lb. daughter of a 40-lb. cow, sired by a son of a 36-lb. cow.

A 26-lb. two-year-old granddaughter of a 36-lb. cow in calf to a son of a 37-lb. cow.

A ten-month-old son of Ormsby Korndyke Lad from a 31-lb. daughter of King Segis De Kol Korndyke.

A 33-lb. daughter of King Segis Hengerveld from a 25-lb. dam.

A daughter of King of the Pontiacs from a 36-lb. dam.

A 36-lb. daughter of King Quality that produced over 719 lbs. butter as a four-year-old, making a sensational yearly record.

A maternal sister to a 43-lb. cow in calf to a son of a 43-lb. cow.

A 31-lb. and 700-lb. milk producing daughter of Prince Hengerveld Pietje, in calf to a son of a 37-lb. cow.

A son of Sir Aaggie Mead De Kol from Ormsby Korndyke Armyn, a 1200- and 26,000-lb. daughter of Ormsby Korndyke Lad.

A granddaughter of May Echo Sylvia. Seven nearest dams average over 700 lbs. milk. The highest of any heifer in her state.

A yearling daughter of Ormsby Korndyke Lad from a daughter of Sir Prilly Segis.

A daughter of King Segis Pontiac Konigen with 825 lbs. butter and 18,475 lbs. milk in 334 days as a three-year-old.

Two daughters of King Segis Pontiac Konigen in calf to Dutchland Creamelle Korndyke Lad.

A daughter of Avon Pontiac Echo in calf to Sadie Vale King.

A daughter of K. P. Lilith Boon, she a 33-lb. full sister to the dam of King Segis Pontiac Count.

Two yearling daughters of King Segis Pontiac Count, both from great dams.

Daughter of Sir Ormsby Hengerveld Korndyke, only living son of Pietertje Maid Ormsby.

Four granddaughters of a 35-lb. cow.

A daughter of Princess Evertje De Kol 4th with 1181 lbs. butter and 25,966 lbs. milk in a year.

Some of the Offerings:

A daughter of Flint Hengerveld Lad from the famous Flint Pauline with her yearly record of 1209 lbs. butter and 30,347 lbs. milk. Her dam is the eighth highest milk record cow the breed has produced.

A 30-lb. three-year-old granddaughter of Maplecrest Pontiac Application, the highest record daughter of Pontiac Aaggie Korndyke.

Two cows in calf to Echo Sylvia King Model, whose three nearest dams are 36-lb. cows.

A two-year-old with four 1000-lb. sisters—her dam, Maplecrest Pontiac Application with 1044 lbs. in a year—in calf to a 1000-lb. sire.

A granddaughter of a 1400-lb. cow from an 800-lb. Ona heifer, two nearest dams both 1000-lb. cows.

A son of the world champion yearling milk producer for 7 days to one year.

A daughter of a 30-lb. two-year-old sired by a full brother to the first 44-lb. cow.

The highest record daughter of King Pontiac Champion —38 lbs.

A 36-lb. cow bred to a May Echo Sylvia grandson.

The Highest Record Cow

SIRED BY KING PONTIAC CHAMPION

PABST CYNTHIA with 38.13 lbs. of butter and three records of over 30 lbs., also with a recently completed very creditable ten months record. She is the highest record daughter of her famous sire, King Pontiac Champion. She is also the highest record cow in the entire sale. Her dam, a 29-lb. cow, has over 20,000 lbs. of milk and over 800 lbs. of butter, third dam also a great producing dam. Pabst Cynthia, a very handsome individual has produced a 25-lb. two-year-old daughter and is due to freshen about ten days after the sale to the services of Echo King Sylvia, famous son of May Echo Sylvia. This is the first time in the history of the breed that anyone has ever had an opportunity to buy a daughter of King Pontiac Champion in calf to a son of May Echo Sylvia. We suggest to those breeders wanting a grandson of May Echo Sylvia from one of the very great daughters of King Pontiac Champion that they be sure to give consideration to Pabst Cynthia. By reason of her superb quality and record, together with her splendid breeding, she will afford her buyer no small measure of pride in ownership and will doubtless deliver to him an offspring that will more than fully repay him for her purchase price.

Son of a 1200-lb. Four-year-old

KING VALDESSA PONTIAC TRITOMIA, a June 1920 son of King Valdessa Pontiac, former Bell Farm herd sire and son of the breed's first 40-lb. heifer, Mabel Segis Korndyke. This young bull's dam is Polly Douglas Fayne, with 32 lbs. of butter and 600 lbs. of milk as a four-year-old and now finishing her year with approximately 1,200 lbs. butter and 24,000 lbs. of milk. She realized $4,700 in the recent Brentwood Sale, being purchased by Bellwood Farm. Her dam is a sister to the dam of Aurora Fobes Fayne De Kol 3d with a record of over 1,100 lbs. in a year. Remember in this calf, you get not only a son of a 1,200-lb. dam, but you buy also a brother to Echo King Sylvia that is heading our herd.

THE BELL FARM is sending only these two animals. They are believed to be and of course are guaranteed absolutely right in every respect. Should they be otherwise, most certainly we should not want you to have them. Not only have they been subjected to the ophthalmic, intradermal and subcutaneous tests, but they are also free from abortion as proven by blood tests. They are as near right as science can determine, and it is the policy of Bell Farm to have interested buyers know as much of its animals as we do ourselves.

BELL FARM Coraopolis, Penna.

Pure-Bred Holstein Heifer Calves

Two six-weeks-old heifer calves sired by a 31-lb. bull, one evenly marked and the other three-fourths white. They have good straight top lines. They are from heifers giving 40 lbs. milk daily. Will sell these two at $80.00 each, will ship C. O. D. subject to inspection. One two-weeks-old by the same sire three-fourths white, from cow giving 60 lbs. milk daily. $75.00. Will also ship C. O. D.

A 16-MONTHS-OLD BULL from a R. of M. 25-lb. dam at $200, and we will ship him on approval. He is three-fourths white in color and will weigh around 1,100 lbs. He is sired by a son of Korndyke Segis Johanna 127123, whose dam is Pabst Carnation 201218, with 32.34 lbs. of butter from 443.00 lbs. of milk. His own dam has 25.11 lbs. of butter from 507.00 lbs. of milk at 4 years, and at two years old, she made 21.28 lbs. of butter and 399.40 lbs. milk. This fellow has a good straight top line, a large middle, and we guarantee him a good, sure breeder.

Yohn Stock Farm, Watertown, Wis.

New York Butter Market

(Continued from page 757)

have on hand Danish dealers are offering butter for future shipment at a price of 30c landed in New York and are asking for bids. That would lead one to believe that even better prices will be offered a little later.

Butter receipts have increased fully 18,000 packages or fully 40% during the past week. However, a high percentage of the increase is centralized butter, about 20 cars of that butter having been shipped to this market from Chicago during the past week. Reports indicate that actual increases in production are about 15%. In spite of the added receipts, there has been scarcely enough butter of high quality to supply the demand. Consumption of butter is exceedingly high at the present time as the consumer is taking kindly to the lowered retail prices of butter. Some of the chain grocery stores are evidently using butter as a lead as they are selling it at 36c. That very naturally gives impetus to buying. Very little butter is carried over in wholesale stores from day to day. In fact, many wholesalers are finding it very difficult to piece out their supplies in such a way as to satisfy their regular buyers.

On Wednesday of last week, prices fell ½c, and that was followed by declines of 1c and ½c on Thursday and Friday respectively. Since Friday there has been no change in quotation even though the strength of the market has varied considerably. Established quotations are: Extras (92 score), 36c; higher scoring than extras (93 score or higher), 36½@37c; firsts (90—91 score), 34@35c; firsts (88—89 score), 32@33c; and seconds (83—87 score), 28@31c.

W. B. LIVERANCE.

Cheese Prices Reach Low Level

(Report by U. S. Bureau of Markets.)

While further declines on the cheese markets were not so generally looked for during the week ending May 7, as they had been several weeks previous, they were not entirely unexpected as dull trading had removed all support from the markets and lower prices were inevitable in order to avoid a glut. The week opened with sales on the Plymouth, Wisconsin, Cheese Exchange a full 1½c under those of the previous Monday, bringing prices to a point lower than they have been since the summer of 1915.

At the close of the week business was generally more active at Wisconsin primary markets and the surplus of Daisies and Twins was being rapidly cleaned up by a fairly heavy export demand. Wisconsin dealers feel that if the market can hold at about its present level for a time trading will soon become much more active.

The average wholesale prices on American cheese (style Twins) for the week ending May 7, 1921, and for the corresponding week a year ago were as follows:

	Week ending May 7 1921	1920
	Cents	Cents
New York	17.8	29.5
Chicago	15.2	28.4
Boston	17.5	30.5
San Francisco	12.4	23.2
Wisconsin	14.5	27.8

The total receipts of American cheese at these markets were 4,436,700 lbs. as compared with 4,050,160 lbs. a week ago and 3,410,364 lbs. a year ago.

Cheese Prices for April

"Going down, down, down," expresses the cheese market for some time, but it was reserved for April to see prices decline to prewar levels. During the month on Wisconsin Boards Twins declined 4½ cents and Longhorns declined 7 cents, with still further declines early in May.

The daily quotations of the U. S. Bureau of Markets show the following average prices for American cheese (style Twins) for the three large markets in April, 1920 and 1921:

	Average price April 1921	April 1920
	Cts.	Cts.
Wisconsin Boards	18.22	29.01
Chicago	18.05	28.14
New York	24.10	29.00

Longhorns averaged 18.73 cents on the Wisconsin boards as compared with 30.32 cents in April a year ago.

Butter Prices for April

The butter market for April showed a decline of about three cents from the March average but this does not tell the whole of the sad story. From the first of April to the last butter declined 16 cents in Chicago, 14 cents in New York, and 12½ cents in Boston and Philadelphia. During the first four days in May prices have advanced somewhat, but the market is not strong.

The following table is compiled from the daily quotations of the U. S. Bureau of Markets and covers the average wholesale prices for April, 1920 and 1921, on 92-score butter (extras), as also the receipts at these several markets:

	Av. Price April 1921	April 1920	Receipts April 1921	April 1920
	cents	cents	tubs	tubs
Chicago	43.64	64.24	193,501	137,914
New York	45.60	71.46	193,202	104,598
Boston	46.42	69.08	51,746	49,449
Philadelphia	47.02	71.42	54,449	39,523
Total receipts			489,898	331,484
Receipts since Jan. 1			1,687,277	1,533,414

Ninety score butter averaged 41 cents for April on the Chicago market with centralized butter at this market selling for 43.3 cents. Jobbers' prices on extras sold to retailers during April averaged 45.2 cents in Chicago and 48.6 cents in New York.

Dairy Markets

CHICAGO, May 13—Butter—Creamery, extras, 31c; standards, 29½c; dairy firsts, 25@30c; seconds, 18@23c.

Clark County, Wisconsin, Sells Holsteins

Clark County, Wisconsin, Holstein breeders held their first annual sale May 3, at Owen, selling 58 head for $12,950, with $700 the top price for a bull and $600 the highest for a female.

Ernest Schoettler bought the highest priced bull, a 6-month-old son of King Korndyke Haidee Ormsby from a 19-lb. dam now on year test, consigned by Philip Mattes.

The top female was a 23-lb. granddaughter of Sir Korndyke Pontiac Artis from a 23.35-lb. granddaughter of Sarcastic Lad. She was consigned by Albert Zenzel and purchased by F. B. Harper.

Mack & Krause did the selling with F. H. Everson in the box. J. Wuethrick was sale manager.

The following list includes those entries selling for $200 or more and buyers:

John Wuethrick, Wisconsin	
Princess Rosetta Posch Ormsby	$550
Princess Pride De Vries	430
Ernest Schoettler, Wisconsin	
King Korndyke Haidee Ormsby 2d	$700
Sam A. Wilson, Wisconsin	
Brookside Aaggie Netherland 2d	$310
Spot Aaggie De Kol	220
F. B. Hafner, Wisconsin	
Jewel Star Pontiac	$600
Plain View Homestead Pauline	200
Earl Tompkins, Wisconsin	
Sunshine Burke	$380
Athalend Dale Lady	205
Nick Scherer, Wisconsin	
Sunshine Burke 3d	$300
Fayne Pride Gerben	210
Phil Mattes, Wisconsin	
Falls Brook Steinser Pietertje	$340
King Pietertje Ormsby of Crows Roost	275
Jacob Anderson, Wisconsin	
Woodward Farm Mary	$405
Lily McKinley Segis	295
Plain View Homestead Lula	200
O. L. Carteron, Wisconsin	
Lily Johanna De Kol Banostine	$220
Makis Korndyke Johanna	250
W. H. Krause, Wisconsin	
Fink Empress Johanna McKinley	$300
Piebe Colantha Posch Lass	390
C. O. Jorenby, Wisconsin	
Frances Wa Wa Terzool 2d	$290
Athaland Queen	250
Athalend Princess	225
H. E. Williams & Son, Wisconsin	
Catalogue No. 33	$310
Herman Sely, Wisconsin	
Beets Pontiac Korndyke	$290
Lynn Harsh, Wisconsin	
Fannie Colantha Cream Pot	$500
Ed. Karlen, Wisconsin	
Clover Hill Daisy Colantha	$500
Imig Brothers, Wisconsin	
Wa Wa Pontiac Grace	$370
C. A. Foster, Wisconsin

Wisconsin's

Northern State Sale

Marshfield, Wis., May 26

70 Registered Holsteins

Clean, Well-Bred, Good Individual Holsteins That Any Breeder Would be Glad to Own.

This Sale is under the auspices and management of the Holstein-Friesian Breeders' Association of Wisconsin. It is the result of a desire to populate the Dairy Empire of Northern Wisconsin with the best foundation stock that we could get together. The cattle entered are such as only a state sale can bring out. Breeders can ill afford to spare them but state pride is a big lever and we used it to get them. Get your catalog from Sec. Oldham.

Make your plans now to attend. You will find it well worth your while.

The cattle will be sold subject to the usual state sale health and breeding guarantees.

Hollywood Farms'

Consignment

TO THE

National Sale at Syracuse, June 2-3-4

A Splendid Daughter of Hollywood Lilith Palmyra

SAFE IN CALF TO JUDGE SEGIS.

She is Hollywood Lilith Rosa Bonheur. She made 20.5 lbs. butter in 7 days at 3 years 20 days and has now finished 5½ months of her semi-official test at a good rate.

Her full sister, Hollywood Lilith Bonheur made 31.59 lbs. in 7 days, 1,174.35 lbs. butter and 29,822 lbs. milk (world record) in a year as a 4-year-old.

Her sire has 25 A. R. O. daughters, 2 holding world records for milk, 6 above 31 lbs. butter in 7 days, 3 above 35 lbs. and one with 38.9 lbs.

Her two nearest dams both have good semi-official records as have many of her sisters.

An Excellent Son of Judge Segis

from Glen Alex Queen De Kol, world record 42-lb. cow that has 3 times made over 30 lbs. and that is from a 42-lb. dam. She has a 30-lb. 2-year-old daughter and one with 22 lbs. as junior 2-year-old. Judge Segis now has 43 A. R. O. daughters and more to come. His sons and daughters suit us; they will, we are sure, suit you.

Hollywood Farms

Hollywood, Washington

Unity Holstein Breeders'

FIRST ANNUAL

CONSIGNMENT SALE

40 HEAD — May 28th — 40 HEAD

Commencing at 12 o'clock.

This is our first sale and we are making every effort to make it a quality sale from every standpoint. In the list of offerings you will find as much, or more, quality, individuality and breeding as you have seen in any sale of its size. You will find A. R. O. daughters of high record bulls and out of A. R. O. dams up to 27 lbs. Ten of the females are bred to a 30-lb. son of S. P. O. M. 43rd, several bred to a 31-lb. grandson of Duchess Skylark Ormsby. Also some splendid large cows bred to a 29-lb. bull. Several splendid heifers from 8 months to 18 months old. A 2-year-old bull sired by a 32-lb. sire and out of a 26-lb. 4-year-old that is on yearly test. A fine bull calf out of a 22-lb. dam, a good one; another 3-month bull calf from a 21-lb. dam and sired by a 1,000-lb. bull. There are two daughters of 27-lb. cows. A daughter of Piebe Laura Ollie Homestead King (a show heifer). A daughter of a full brother to Count. Space will not permit mentioning all the good things. All the usual guarantees go with all cattle. See catalog.

TERMS: Cash, or 10% down and balance six months' time on approved notes bearing 7% interest.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Jimmy and Bob Again

The Turn in the Road

"What would you say, Bob, if I told you that I am winding up my agricultural studies this semester," Jimmy broke forth one April evening as the two sat on the opposite sides of the old study table, occupying the center of their room.

"Well, it would depend upon why you were quitting," Bob answered quickly, glancing up from the opened page before him. "If it were for a good purpose that you could justify, I probably would say, go ahead, that's the thing for you to do, but if you have just lost faith in yourself, I'd say stick."

"I've got all the faith I ever had and then some," he quickly returned, "and I also have a real good reason for saying to you that this is the last semester in the study of agriculture for me, that is I think it is, the way I feel tonight. I've had this feeling for some time, too, and ever since being on the winning team of that debate I have been getting more and more discontented. I can go through with this all right and go back home to the farm as we have planned all along and be successful, too, and for that reason I hate to quit. But somehow I feel that I would like to go into the study of law. I guess my preparation for debating has turned me in that direction. Why, I can already picture myself winning cases for my clients," he smiled. "Yes, law has made a special appeal to me, particularly the platform side of law. But if I do make the change, I shall always be interested in the problems of agriculture and I think that it is just as large a field to work in as I ever did. My opinion hasn't changed there a bit. But I've practically made up my mind to make the change and I wanted you to know it. And when you are in need of the services of a good lawyer, you'll know where to get him," he smiled at Bob in his old time way.

Bob was listening intently. He had been expecting something like this from Jimmy for it had appeared to him more than once of late that his chum was fast drifting into other channels to which a college training points the way. In several of their recent conversations Jimmy had casually dropped remarks that led him to believe there were other fields that his mind was evidently exploiting, and so now he found himself quite ready to face his friend in whatever arguments the conversation might involve.

Jimmy had continued his membership in the Agricultural Literary Society with the same active interest with which he had started two years ago. In fact he was now considered its leader by all the other members. He had won in several of the debates against other university organizations of like nature, at least this is the credit that was accorded him. And when it came to a finishing fight which the average debate involves Jimmy, with his clear thinking and platform finish, usually furnished the element which makes the decision for the judges an easy matter. He had not only supported his college literary society by taking active part in each of its meetings, but he had really made a conscientious effort to develop himself in the art of platform oratory. He had studied in the Department of Public Speaking such courses as would contribute to his training along this line.

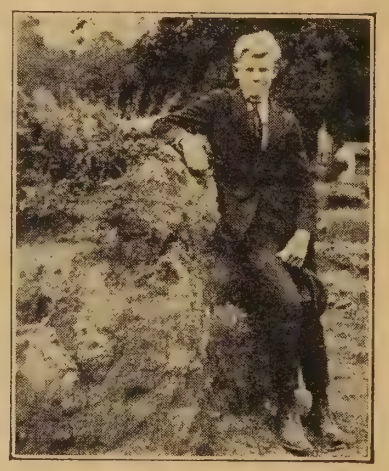
And when it came to the try-outs to select a team for the intercollegiate debate with the University of Minnesota, Jimmy was the first selected to represent his institution. This came as neither a surprise to himself nor to the student body, for he was recognized as the best debater in the university. The question to debate had been, "Resolved that the Fordney tariff bill would benefit the American farmer." Jimmy was on the side representing the affirmative. From the time of his selection for the team up to the evening on which the event occurred, he stole all the time he could from his studies to prepare himself. He scanned the papers daily to find there any trace of opinion, public or official, that might aid his argument. He had correspondence with some of the officials at Washington and also with some of the leading farmers of the country. He ransacked the city libraries for references, drawing from them all the books that he was entitled to at any one time, and he never wasted the opportunity to talk both sides of the question with those from whom he could secure an audience. He was out to win, no matter what the cost to his studies and to his sleeping hours. And when the evening came to win or lose, he enthusiastically remarked to a group of his fellow students: "I can lick them alone."

And he did. At least that is what the audience whispered among themselves as he wound up the arguments for his side of the question. It was apparent from the time he took the platform to the moment when time was called on him, that he was master of the situation. He flayed his opponents with masterful rebuttals which brought applause upon applause from the packed house. It would have been difficult indeed to have pictured him in this position but two short years back when he and Bob left the farm to enter the university to study the science of agriculture, then what would be termed a green, raw recruit, fresh from the farm, discontented when he compared his lot with Bob's. But in spite of the disadvantages which he had always claimed for himself, he came with those qualities that go to make men; yes, and more than that, powerful men. The responsibility that the elder Greene had placed upon his young shoulders in helping to earn the family bread had left its imprints. He was regarded by the faculty of the university as one of the most responsible students the institution had and so what to him had meant nothing more than hard work as a boy on the farm, had now really become an asset to his developing career. He had inherited a keen mind and the two years of consecutive college training had shown its possibilities. Of health, he had come with an abundance, and as he stood there on the platform that evening, his entire being radiated the strength and vigor that only rich red blood can give—a young giant in both strength of mind and body.

And the one thing, which as a boy of fifteen he had always deplored—plain looks—had given way to what others were now terming a strong, masterful face. It was indeed quite true. Nature had been good to him, for any wrong that had been done him in his youth—if it could be termed such—was certainly undergoing repairs as he was entering into his young manhood.

His firm jaw and square, dimpled chin bespoke the youthful power for which he was known. The cat-like greenness of his big penetrating eyes had given way to the grayness of steel, and were it not for the softening effects of the heavy auburn eyebrows, stretching above with hardly a break as they crossed the distance between them, they would be considered hard, cold eyes. The freckles, always reminding one of little deserts in the promised land, had almost disappeared, leaving a soft, glowing complexion that was even the envy of the fairer sex who considered it their good fortune to know him.

The pug in his nose had somewhat unpugged, and what was left blended so nicely with the contour of its surroundings that one would be almost inclined to regard it as an attractive nose. The stubbornness in his red hair, now more brown than red, had been reduced to submission and unlike most of the other college boys who combed their hair straight back, he adhered strictly to a left-sided part.



And from all this solidarity of feature, there radiated the warmth of a generous smile which, when at its best, reduced his eyes to mere slits and from whose corners there twinkled the merriment of which their hard, gray color had cheated them. In this face there was pent up all the hope and enthusiasm for a successful career that was ever expressed in boyish features. Jimmy had found himself and all of this had happened in the first two short years of his college life.

"And if I do make a change," Jimmy continued on the evening which the conversation took place, "I wouldn't want to take any of the credit that might follow for me in a successful career in the law business. But I do believe that I have found myself—no not exactly that," he hesitated. "I mean that from the inspiration and guidance of some of these college profs, I have been able to do this. And so I have made up my mind, Bob, that this is my last semester in the study of scientific agriculture. I have threshed this all out with myself during the past two months and now my mind's made up I feel lots easier. It's going to be mighty hard, old man, to leave you and the cow college," and his voice showed considerable feeling as he spoke. "I hate to think of not returning to the old farm with you, Bob, when all is over down here," he continued, "but I guess that's going to be the case." Up to this point, Jimmy had been staring steadfastly up at the ceiling as he spoke, apparently disliking to confront his bosom companion with the announcement he had just made. But suddenly he concluded by arising from his chair and placing himself directly in front of his listener, saying as he did so, "I know you will object, Bob, but tell me what you really think of what I am going to do."

As was always his custom when confronted with a problem to decide or an opinion to be given, Bob straightened up and cleared his throat, a habit which more than

JIMMY

BOB

OUR TWO HEROES AS THEY APPEARED IN CALF CLUB DAYS

"I WAS BACK IN CLUB WORK AGAIN, THE YEAR YOU RAISED BETSEY."

once had been the occasion for the remark from those who knew both, "a chip off the old block".

"It's hard for me to say anything, Red; I think that you have said about all there is to be said. I am not surprised in the least from what I have observed this entire year, and especially since the inter-collegiate debate. It was plain to me, then, that you were slipping—no that's not the word, for if you are choosing the thing you want to do and for which you are best fitted that wouldn't be slipping—but rather acting wisely. So we'll take for granted that your decision is for the best as much as I dislike to think of it. I think, myself, that you are probably doing the best thing, for you certainly have developed into a fine speaker and, with the pace you are setting for yourself, there is no telling what the future has in store, for you have demonstrated that success will attend you in whatever you undertake. It's what I always have predicted for you ever since we started in club work. It was there that you first showed the determination that is winning for you the distinction that you are now enjoying.

"But it is hard, Red, to say the least, when I stop to think of how we had the past linked up with the future—our growing up in the same community, attending the same little white school, graduating in the same class from high school, going through college together, and planning to return to that community to work in the cause of better rural conditions. But if it must be the way you have decided, I'll have to make the best of it and as you have said that if ever I am in need of a lawyer, I'll know where to find one who can win for me," he concluded with a far away look in his eyes.

"What about yourself, Bob?" Jimmy interrupted, as if to terminate the conversation about his decision. "Have you ever thought of other fields since being here?"

"Indeed I have. You don't think that I've been asleep on the job, do you? But it has always been the same conclusion—the farm is the place for me. I love it, with all its open beauty and fine people. I want to do the thing where I will be of the most good, Red, and farming's that thing. My mind is just as firm today on that point as it was in the beginning and I'm proud of it."

A long silence followed in which each was deeply engaged in his own thoughts about the future. Jimmy was the first to interrupt with, "A penny for your thoughts, Bob".

"Not on your life," Bob answered. "I'm thinking things that money can't buy, but I'll tell you free of charge," he smiled good-naturedly. "I was just trying to repeat to myself Edwin Osgood Grover's creed for the country boy, you know the one I mean; we both learned it when we were in the club work."

"Do you still remember that?" Jimmy shot out. "Gee that is a fine thing, Bob. It made a great impression on me, but I can never remember things like that. Let's see, how does it go?"

"I've got it," proclaimed Bob, and before Jimmy could get the words out of his mouth asking for it, he had started to repeat, 'I believe that the country which God made is more beautiful than the city which man made; that life out of doors and in touch with the earth is the natural life of man. I believe that work is work wherever I find it, but that work with Nature is more inspiring than work with the most intricate machinery. I believe that the dignity of labor depends not on what you do, but on how you do it; that opportunity comes to a boy on the farm as often as to the boy in the city; that life is larger, freer, and happier on the farm than in the town; that my success depends not upon my location, but upon myself—not upon my dreams, but upon what I actually do—not upon luck, but upon pluck. I believe in working when you work, and in playing when you play, and in giving and demanding a square deal in every act of life'."

"That surely sounds good, Bob," Jimmy almost shouted in his enthusiasm. "For a minute, I was back in club work again, the year that you raised that Betsey calf. Wouldn't you like to see her now?"

"Wouldn't I though," answered Bob, "yes, and Star Face, too. You remember how I hated to see them go way off to Texas! Ah, those were the good days, Jim, when we didn't have to worry ourselves with decisions like you are making tonight. But I suppose this is something that comes into the life of every man who is going to be a success. He must decide the goal toward which he heads his ship, and when once decided, he should steer straight for it."

"Yep, I guess you're right, Bob, and it kind of means the parting of the ways, doesn't it? Do you know that when you were quoting that creed a moment ago, it almost undid the decision I have made. It brought back with such force so many pleasant thoughts that I was almost convinced that I am doing the wrong thing to make the change. I am beginning to think that you repeated it just to make me feel homesick, you old rascal, because you surely did, and if I could leave here and never come back, I'm sure of where I'd end; that would be right at home on the farm. But since my training here has developed some talents that I didn't realize I had and has pointed the way to a field more to my liking, I feel that I have done right in deciding the matter as it has been done, and let us hope that it will never be regretted."

"Well, we've been sitting here for an hour now, Red, and we haven't started to study yet," Bob hinted.

"Don't know as that is any cause for worry, old man," Jimmy laughed back. "Studying isn't half as important as deciding things the way we have tonight. We'll get back to them on time, Bob, don't worry about that. You'll be an honor student in your class, even if you should take tonight off," he added a little sarcastically.

As a matter of fact Bob's name had appeared in the daily Cardinal, the student paper, but a few days back, heading the list of honor students in his class. The recognition was based upon scholarship and grade points and he ranked the highest in his class. Bob had always done his school work first and when there was time left, he took it for interest in other things. Jimmy, on the other hand, was not as consistent about his studies. If the outside activities needed his time, he was there, so he could not be expected to have the high scholarship that Bob had made for himself. Both had won distinction; Bob, by leading his class; Jimmy, on the platform and football field, for he was about as active in that sport as he was in the art of debating. But we would not want you to think that Jimmy was not a good student. In fact, with all the time he spent in student activities, he was a little above the average.

"Well, the change you are making means that you will be in school longer than I will," Bob remarked. "Looks

I have a few choice improved and partly improved farms in the famous potato and dairy region of upper Michigan, 40 to 160 acres. Low prices and easy terms. JOHN MAJOR, P. O. Box 198, Marinette, Wisconsin. 16-13

We have three quarter-sections of land in Bottineau County, North Dakota and two quarters in Renville County, North Dakota. We are in the market to exchange a quarter or more of this land for some registered Holstein cows or heifers. We would want them to be of good quality, and we would price the land right. We have a 1,200-acre stock farm close to our place of business here in Illinois and could use these cattle to better advantage than we can the land in North Dakota. If you have anything to offer, kindly let us hear from you stating the age of your cattle, the number, the price, and whether or not they are tuberculin tested. BANTA BROS. & CO., Lowpoint, Illinois. 16-3

Register and secure a Farm—Our colonization plan offers the man who wants a farm a greater opportunity than a U. S. Homestead. Good man can register and get good land, and we furnish him 4-room house, barn, cows, and tools. To show good faith settler deposits $500 on buildings and stock—that's all. After 3 years, settler pays for farm at $100 a year. Over 100 registered, got farms and started last year. Many from Wisconsin. Good places on new road ready right now, so write for free books, maps and registration blank, or come at once to look. NATIONAL LAND COLONIZING CO., Box A15, Ladysmith, Wisconsin. 16-3

Hardwood cut-over land, silt loam, clay sub-soil. Neither sandy nor gravelly; close to town; good roads; good schools; in the heart of the dairy country. You deal directly with the owners. No agents and no commissions. Easy terms. Also improved farms. Write for map and Booklet No. 4. NORTH WESTERN LUMBER CO., Land Department, Stanley, Wisconsin. 1*

A Healthy Calf

—is the result, not only of good feeding, but of **protection** against germ infections, such as scours.

Experience has taught the wise cattle man to rely upon a good safe disinfectant. A bottle of B-K is his helpful agent. When used internally it destroys germs, acts as an anti-acid and sweetens the stomach, heals inflamed membranes, relieves irritation, restores healthy action. B-K contains no poison, acid or oil and may be given freely in the milk and drinking water.

Never be without B-K—You will surely need it—and, it is always ready. Sold everywhere.

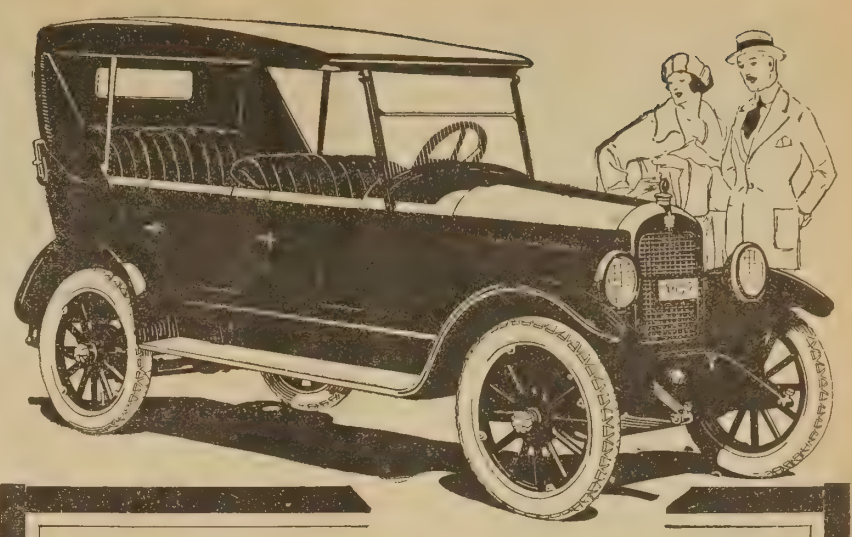
Wanted—Experienced man on dairy and general purpose farm. State experience, age and weight in first letter. O. PAUL SCHWEFEL, Oakfield, Wis.

Minnesota Holstein Breeders Meet



"The best meeting we ever had," was Secretary Scott's description of the Minnesota Holstein Breeders' annual meeting held May 3 at Faribault, and he was right in his statement. It was an exceptionally good meeting with an attendance well above that of any previous one.

Blue Earth County alone supplied nearly 100 automobile loads and while they were not all Holstein breeders they were all Mankato boosters who got what they came for—the promise for the 1922 state meeting and sale at Mankato.

In addition to the routine business the association dues were raised. Hereafter each member pays fifty cents per head for the number of pure-breds he owns with a $10.00 minimum membership fee and $5.00 the minimum fee for grade breeders.

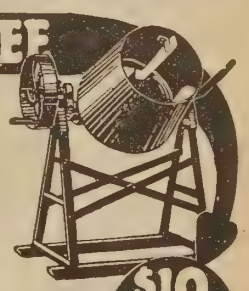
The major portion of the afternoon and evening was devoted to the entertainment provided by Rice County and be it known, the men of that county qualify as A-1 entertainers. One hundred cars took the visitors for a tour of the Holstein herds of the county with a splendid banquet and program at Carleton College for the wind-up.

The milk campaign work of the Dairy Division is bringing big results this season. Miss Hoover, milk campaign specialist, is just home from the latest campaign, at Wheeling, W. Va., where she reports the usual success, and special interest among the children of the public schools. A feature was a "milk parade" arranged for a public demonstration. Hundreds of girls from the schools took part, companies being specially costumed to represent the various uses of milk in the diet, and its food and health protective and growth promoting value. This "milk parade" is to be given in Washington, in the early future, if Miss Hoover can work out her plans and is to be filmed here for general use in the educational films being made by the Department.

Sturdy, Stylish, Comfortable
Costs Little to Run

That is the verdict of thousands of farmers who are driving Briscoe cars. The 1921 Briscoe is the best car built today, and the nearest Briscoe dealer will prove it to you.

BRISCOE
The Trustworthy Car



Put the Briscoe to any test you choose—hill-climbing, bad roads, quick get-away. See how far it will go on a gallon of gas. See how comfortable it is, even over the roughest going.

It will give you more car-value per dollar than any other car made, bar none. Prove it for yourself.

Free booklet on request.

RIGHT now is the time to get your KWIK-MIX Concrete Mixer—Special Easy-Payment-Offer and reduced prices for this month only.

Before you buy any concrete mixer or start mixing with a shovel, let me send you the wonderful KWIK-MIX Concrete Mixer on 30 days' free trial.

Post yourself on latest, most up-to-date mixer before you go ahead. Don't take chances spoiling a job with hand-mixed concrete. Get a KWIK-MIX and be sure of a perfect mix. Saves time, labor, contractors' profits---pays for itself on first job.

The original reverse-action mixer---loads from one side---close up to pile of material---dumps finished mixture other side into wheel-barrow or directly into forms. This new improvement saves a great amount of time and labor---yet KWIK-MIX costs less than the ordinary mixers.

Steel frame---built for hard use---yet light and easy to move. Capacity, three cubic feet a minute---hand or belt power---fully guaranteed.

KWIK-MIX CONCRETE MIXER

$10 AFTER 30 DAYS TRIAL

Easy Payment Send no money. Most liberal terms ever offered on a mixer. Pay only $10 after 30 days' trial, balance $10 per month for four months. Two per cent discount for cash. Write for full particulars.

For every road and every load—the Kelly Caterpillar

There are some types of truck tires that do very well in certain sizes and in certain kinds of service, but there is only one type that is equally good *on all sizes of trucks, in every kind of service.*

The resiliency of the Kelly Caterpillar, its ability to get traction and its consistently great mileage place it absolutely in a class by itself.

Whether you use light trucks or heavy, whether your tire problem is one of getting traction under difficult conditions or merely one of finding tires that will last, there is a size of Caterpillar that will answer every demand the truck may put upon it, at a lower cost than any other type of tire you can buy.

When Writing to Advertisers, Mention Hoard's Dairyman

Jimmy and Bob Again

(Continued from page 762)

as though you had wasted some time by staying in this college as long as you have."

"I should say not," retorted Jimmy. "These two years have been mighty important ones for they have made me open my eyes and take advantage of all the good things about us. Why these two years are going to make a lawyer out of me," he laughed, "and besides their influence has extended farther than that. You don't see how I figure that, do you, old man?" he said, noting the puzzled expression spreading over Bob's face.

"Hardly," Bob replied. "I don't see that it has concerned anyone but yourself."

"Well, then, let's just take an inventory of their influence," he replied, "and I think there will be no doubt left in your mind as to their value. First, we will credit them with having been all important to me in leading me to find myself, to say nothing about the fund of important information which I also have to my credit. I'd say that every one ought to have this information about the most important of all occupations, and I don't doubt but as a lawyer I will have plenty of opportunity to use some of the things I have learned these two years. It certainly makes one appreciate the problems of production and gives him a much broader viewpoint of what life really means.

"And think what it has meant to the rest of my family! I'll just tell you if I hadn't written those letters home to dad, he'd never had his eyes opened the way he has. Since I've been down here, we've had an entire outfit of new buildings on our place, everything up-to-date. Our herd of cattle is practically all pure-bred now and they are taken care of the way they should be, and no one appreciates it more than dad himself, either. We're growing all pure-bred grains and corn, too, and the Greene farm has more acres of alfalfa now than the Ramsey farm, if I'm not mistaken. And all the crops are grown in a strict rotation now, too; corn, then a small grain seeded to clover and timothy, then hay, and last pasture and back to corn. Yes, and dad's using lime now, and I happen to know that he and Hank Peters bought a carload of that stuff this winter, and Jerry's got it all spread on the land by this time, ready to seed another piece to alfalfa next spring. That's what I call progress," he proudly concluded, "and you can just bank on it, all of this wouldn't have happened if I hadn't been down here these two years. So you can just credit all of this to the time spent in the agricultural college, along with what it has meant to me. And probably fifteen or twenty years from now, it will be Secretary of Agriculture Ramsey and Senator Greene," he joked good-naturedly. "That would be great, wouldn't it, Bob," he reflected, "and you never can tell what will happen when a fellow gets to going. Anyway, we're headed in the right direction."

"Yes, but have you stopped to think of what your dad and Jerry are going to say when they know what you've done?" Bob inquired.

"Oh, dad will storm about it for a while," he replied "and of course it will almost break Jerry's heart. He was so set about the two of us running the farm. But he'll get over that and 'twill give him a better opportunity, too, if he has the farm to himself. Anyway, I have to live my own life, and one can't afford to sacrifice too much just to please the other fellow. I'll break the news to them all the week I am at home for spring recess. Dad's not an old man yet and he won't be leaving the farm for some time to come. I can justify my act and that is all there will be to that and next fall yours truly begins the study of law."

"But what about Jerry?" Bob asked with some concern. "When will he start in college? Will he have to wait longer now just because you will not be through in two more years?"

"No, Jerry will come down here at the same time as we had planned for him," he firmly replied. "Isn't going to make the least bit of difference, and he is going to study agriculture as we had planned. Jerry's cut out for a good farmer, and he'll be one, too. He won't change his mind the way I have; he's got too much sense for that and after he thinks it all over, he won't be blaming me, either. You know he always has been just a little skeptical about my returning to the farm ever since I left home. No, everything will turn out all right," he tried to convince himself, well knowing, however, that there would be a great deal of dissatisfaction when his folks found out. "I'll tell you one, though, who will take my part," he emphatically added, "and that is ma. She's always had a lot of confidence

in me and she will think it is great to have a lawyer in the Greene family; that'll sound pretty big to her ears—God bless her," he added, as he broke into a hearty laugh.

Ten Bulls' Eyes in the Present Agricultural Marketing Situation

Organization is essential to marketing improvement. There is a growing need of a consolidation of local marketing units on a community basis. This should enable each concern doing business to be of such size and efficiency that it may render essential marketing service at minimum costs and hence handle products for a smaller portion of the consumer's dollar.

The consolidated local units should be federated into a distributing or sales system in order to enable each local unit to gain benefits from a system sufficiently large to be capable of building markets and standardizing prices as far as that is economically and competitively possible.

This would be done by

Building up adequate financing arrangements.

Storing seasonable surplus for sale in deficit producing periods.

Obtaining adequate supply and demand facts concerning markets the country over.

Providing necessary and adequate connections through which products may be sold constantly.

Advertising to expand markets and create or engage a stable consumer demand, and

Placing adequate premium upon quality production to guarantee consumers a supply of what they want and farmers the best obtainable returns for their efforts.

Through such organization commodities should bring what the market will afford, recognizing:

That cost of production facts will enable a farmer to know what to produce and what not to produce.

That by no means yet discovered can cost of production be made the direct basis of price in a competitive industry.

That organization need not result in monopoly, but rather in the development of efficient marketing machinery.

That the farmer is entitled to all that the market will afford, but such is not obtainable without organization.

B. H. HIBBARD.

MORE PORK IN LESS TIME

Duroc-Jersey hogs have a tendency to put on great amounts of pork at an early age. They are easy-feeding animals, and raise large families. These hogs were introduced less than 50 years ago, and yet in 1918, 51% of all the hogs marketed in the country were "Duroc-Jerseys." They are uniformly red in color. Increase your profits by raising Duroc-Jersey hogs.

Write for "DUROC-JERSEY HOGS ARE PROLIFIC AND PROFITABLE"—sent free to hog-raisers by the largest swine record association in the world. Over 12,000 members.
The National Duroc-Jersey Record Association. **Dept. 300** **Peoria, Ill.**

Hampshire Records Lead All Others

Clay Robinson & Co. sold them—Swift & Co. bought them at $4.50 above the top of the yards—Of all the big type breeds they were the youngest and biggest

GRAND CHAMPIONS OVER ALL BREEDS INTERNATIONAL 1920.

The hog that dresses out a higher percentage of high priced meat with a less percentage of lard. Hampshire means the greatest economy in production.
The largest for their age and the only carload of spring pigs to show in the heavy weight class.
For information and literature on the best of breeding stock, address,

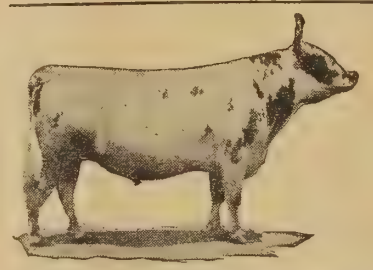
MIDDLESEX MEADOWS FARM

OFFERS
Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.

Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we **KNOW** you can't get as good as these two for any less money elsewhere.



A. Henry Higginson (Owner). **W. R. COUTTS, (Supt.)**
South Lincoln, Massachusetts

Monstone Farm Ayrshires

"Production — Size — Individuality"

Wm. Nisbet & Sons. Richland Center. Wis.

Early Silo History in the U. S.

(Continued from page 743)

available every fall in the sugar beet districts; also green forage, such as Indian corn fodder, green clover, grass, etc., was treated by this method; the fodder being placed in pits ten to twelve feet square, or larger, and as many feet deep; these were often lined with wood and puddled below and at the sides with clay. The fodder was spread evenly in the pits, and well trampled down; when the pit was full the whole was covered with boards and a layer of earth one to two feet thick; such pits would hold nearly ten tons when full. It is stated that the silage thus obtained 'remained green and was well liked, even by sheep'. This practice slowly spread; in the sixties over 2,000 tons of Indian corn was thus made into silage annually in a single small German province where dairying is an important industry.

"One of the earliest advocates of the practice was M. Reihlen of Stuttgart, Germany. His communications on the subject gave an impetus to a large amount of experimentation and study along this line, both among German and French farmers. The French farmer, Auguste Goffart, whose name by most writers has been connected with the origin of silage, in 1877 published his book, 'Manual of the Culture and Siloing of Maize and Other Green Crops,' which book is the first monograph on the subject ever published, and embodies the experience and results of twenty-five years' study of the problem by the author. While Goffart has no claim to priority in inventing the method of siloing green fodders, he perfected and applied it on a large scale, and in publishing the results of his experience brought the subject to the general attention of farmers; he may, therefore, justly be called the 'Father of Modern Silage'.

"The earliest mention of the subject in the United States was through accounts of European experience in our agricultural press; the first complete description of the system was given in a paper on 'The French Mode of Curing Forage', published in the annual report of the United States Department of Agriculture for 1875. Goffart's book was translated in 1879, by Mr. J. B. Brown of New York; this translation, as well as Dr. J. M. Bailey's "Book of Ensilage", published in 1880, first made the subject of silos and silage more generally known among American farmers and the system soon found its enthusiastic followers in the United States. The first silo built in the United States is said to be that erected by Mr. F. Morris of Maryland in 1876."

Association Notes

(Continued from page 749)

er. Two new members started official testing. A pure-bred sire replaces the last scrub, making this association now 100 per cent pure-bred sires. Two milking machines were installed.

Macoupin County, Illinois:—We now have one hundred per cent pure-bred sires. Several members are ready to start semi-official testing. During April market milk testing 3.5 per cent sold for $2.28 per cwt. Three cents were paid for each point above. Milk retailed for 12c per quart.

Monona—Farmersburg, Iowa:—During the year just completed 99 cows were sold and 13 registered bulls were bought. Four men replaced beef cattle with dairy cattle, 4 bought foundation females for registered herds, 6 herds tested for tuberculosis, 18 other herds have application in for testing. Ten new silos were bought, 316 cows were in milk 10 or more months, averaging 6,250 lbs. milk and 260.93 lbs. fat. One hundred and six cows produced over 300 lbs. fat, 14 over 400 lbs. fat, and one over 500 lbs. W. J. Allert owns high fat cow, Blackie, a grade Jersey. She is seven years old and produced 9,522 lbs. milk, 518.3 lbs. fat, profit above feed cost $189.64. S. J. Littie owns high milk cow, Mary, a grade Holstein. She produced 11,217 lbs. milk, 398.9 lbs. fat, profit above feed cost $158.40. Two cows made over $200 profit above feed cost, 142 others went over $100 profit above feed. There were 483 cows tested during the year which produced 2,543,969 lbs. milk, 104,947.1 lbs. fat at a feed cost of $30,238.41, giving a feed cost for 100 lbs. milk of $1.19 and 28.8c for one pound of fat. While there was not a cow tested in Clayton County in April, 1918, we now have four cow testing associations organized in the county.

Stratford Co-operative, Wisconsin:—During April milk testing 4 per cent sold for $2 per hundred pounds. Six cents were paid for each point above. The cheese factory paid 59c per pound for fat. Milk retailed for 10c per quart and butter for 54c per pound. Bran sold for $26 per ton; oil meal, $42; Balanced Ration, $48.

BROWN SWISS

BETTY OF LAKE VIEW

Breed Brown Swiss Cattle

They prove their superiority over other breeds when subjected to trying conditions on the farm, by keeping in good flesh and filling the pail while other cows grow thin and reduce their yield. You can prove this to your satisfaction.

Fond du Lac County and Winnebago County Guernsey Breeders' Association Joint Sale at Fond du Lac on June 3rd.

FOURTH SEMI-ANNUAL JOINT SALE OF THE

Winnebago and Fond du Lac County Guernsey Breeders' Ass'ns

Fond du Lac, Wis., June 3, 1921

SALE PAVILION 10:30 A. M.

57 High Class Females

9 Excellent Bulls

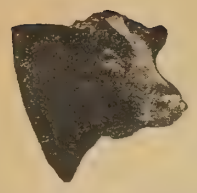
Among the bulls are sons of Erma's Dolly, 676 lbs. Class F, Beauty of Lindenwood, 618.89 lbs. fat and she out of Beauty Eagle, 846.31 lbs. fat and other cows with large records or now making large records.

Over half of the females in the sale are either Advanced Register cows or are out of Advanced Register cows.

Cows and heifers in this sale are either sired by or are in calf to some of the greatest bulls of the breed, including Cherub's Prince, Dairymaid's Nonpariel of Iowa, Pencoyd Leader, Langwater Kinglike, Pencoyd Crackerjack, Queen's Golden, Jessy Rose's Pride of Iowa, Sunkiston, Superb of Edgemoor, Rex's Champion of Maple Hill, Langwater Leader, Langwater Islander, Brookmead's Patriot, Langwater Frenchman, Goldseeker of Anna Dean Farm, and many other bulls either of great breeding or themselves A. R. sires of note.

The joint picnic of the Fond du Lac County and Winnebago County Guernsey Breeders' Associations will be held at Lone Tree Farm owned by Victor F. Lawson, Green Lake, Wis. on June 2nd.

We hope to make this the biggest Guernsey picnic of the year, as many breeders will want to see the wonderful estate of Mr. Lawson and the splendid herd of over 100 Guernseys.



This with the two sales at Fond du Lac on June 3rd and 4th will make a series of Guernsey events that you cannot afford to miss.

Visitors will also have an opportunity to visit Corium Farms that is only ¼ of a mile from the Fond du Lac Sale Pavilion and there see Prospect's Rose des Houards, and Cherub's Prince both winners of Senior Champion at 1919 National Dairy Show, and highest priced cow and bull of the breed. Corium Farms will show many others almost as noted, and opportunity will be afforded visitors to visit other farms adjacent.

The cattle in the sale will all be guaranteed breeders, and sold subject to 60-day retest.

For Catalogs Address Charles L. Hill, Sale Manager, Rosendale, Wis.

Folly Farm Dispersal Sale at Fond du Lac, June 4th, 1921

Economy in Production ← **GUERNSEYS** → Quality of Products

The Guernsey is a medium sized cow that produces with greatest profits large quantities of milk and butterfat of the highest quality. She is exceptionally gentle and responds promptly to good feed and care. Send for our free literature.

Clark County Guernseys

Third Annual Consignment Sale

Owen, Wis., June 2nd, 1921

45 — Registered Guernseys — 45

Most of the offerings are young cows and yearling heifers. Also about 12 heifer calves under 6 months of age. Here will be your chance to get those calves for that boys' calf club. A few choice bulls of serviceable age. 50% of the stock is out of Federal Accredited herds. Those not out of accredited herds will be tested before sale day, and sold subject to a 60-day retest. The association has pleased in the past and endeavors to please the Guernsey buying public by holding clean and honest sales. You will be surprised when looking through the catalog of the choice animals that are consigned by the breeders to convince the public that we have good Guernseys. Plan to be with us.

Auctioneers: Krause and Lemanski. G. R. Ingalls in the box.

Southern Wisconsin Guernsey Breeders' Sale

June 7th

Fort Atkinson, Wis.

70 Head of Select Guernseys from the oldest and best known Guernsey herds in Southern Wisconsin will be sold at this sale.

Such distinguished herds as are owned by Hoard's Dairyman, A. R. Hoard, Ralph Tratt, S. A. Merriman & Son, W. A. Munn, and the Tilden Farms will be represented by some of their best specimens of the Guernsey breed.

Among the 70 Head to be Sold will be Found:

An A. R. daughter of Princess Deasie's Son, Junior Champion Bull at the Wisconsin State Fair, 1915. His two nearest dams average 788.69 lbs. fat. His dam is Princess Deasie (687.80 lbs. fat) former Class Leader; she is a daughter of Imp. Queen Regent IV. (889.57 lbs. fat).

Two full sisters—daughters of Sir Snowdoun, sire of 8 A. R. cows that average 403 lbs. fat, 8,024.80 lbs. milk at an average age of 2½ years. "One of the best sires ever at the head of the W. D. Hoard Herd."

Granddaughters of:

A. Selma's Glenwood—a great son of Selma of Pinehurst (762.88 lbs. fat) the first cow of the breed to make four records of a year's duration each.

B. Glenwood Boy of Haddon—sire of the great producer, Dairymaid of Pinehurst, who holds second place in Class B with her record of 910.67 lbs. fat and second in Class E with her record of 860.26 lbs. fat.

C. Glenwood's Stranford—sire of 3 A. R. cows from 649 to 739 lbs. Out of a 725-lb. cow.

Freight Bills—or Dollar Bills

You, Mr. Farmer, Have the Say

EACH year, Canada routes 120,000,000 bushels of wheat, or about 60% of her export, through the United States on its way to Europe. The United States gets the freight charge return—***and no more!*** This wheat passes through our ports to turn the wheels of foreign mills—***to depress the world price for wheat and to lower yours.***

No tariff can change this condition. The one factor that determines whether you are to receive much or little for the wheat you grow is the world price level which is fixed in Liverpool, England, and which varies with the supply of wheat in the world market. The average amount handled in the world market is 650,000,000 bushels—of which Canada supplies almost a third. Therefore, if any part of Canada's wheat can be kept out of the world market, the natural result will be an increase in the price you get for your wheat, at home and abroad.

The millers of this country, who are the farmer's best customers, buying about 80% of his wheat each year, have suggested a plan to stop Canadian wheat in transit, mill it in American mills, by American labor—and export it as flour under American brands. If this plan is adopted it will mean—

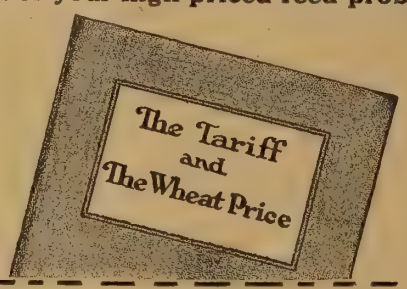
More U. S. wheat milled at home—More money for your wheat—More and cheaper dairy feed—More fertilizing elements for U. S. Farms—More work for American labor.

To accomplish this, let the American Miller buy Canadian wheat, pay the the duty and when he exports the same amount of flour, give him back the duty. The flour MUST go abroad—otherwise he loses the duty he has paid.

THE first thing this plan will do will be to increase the use of American wheat in American mills. If the miller is to get back the duty he pays on each 100 pounds of Canadian wheat **he must export 100 pounds of flour.** But the 100 pounds of Canadian wheat makes only **70 pounds of flour.** Therefore, he must use 43 pounds of American wheat to make the total 100 pounds of flour which he must export in order to get his duty back. As the farmer gets more for his wheat from the American miller than he does in the foreign market, every additional pound of wheat used at home will help to raise the price of wheat.

DAIRYMEN!

You, Especially, Will Be Winners



The marked decrease in the amount of United States flour exported during the past few years represents an annual reduction in the supply of mill feeds in this country of 300,000 tons. **That is the big reason for the high price you pay for feed today.**

Here's where you gain under the plan proposed. Each million bushels of imported wheat milled and re-exported as flour would leave in this country 9,000 tons of dairy feed in addition to the 4,000 tons produced from the enforced use of domestic wheat. **Thirteen thousand tons of dairy feed available for every million bushels of Canadian wheat milled!** Enough to produce 5,000,000 gallons of milk. **This increased supply would most certainly reduce the price you pay for feed.**

The milling of Canadian wheat, therefore, is the big step toward the solution of your high-priced feed problem.

Congress is working on the Tariff NOW---Act Quickly

A note to your Congressman and United States Senator will help to establish this draw-back privilege on Canadian wheat. Write them at once—they are working on the Tariff now. Or, if you wish more complete details, write us for the booklet—"The Tariff and the Wheat Price" which tells the whole story.

Every farmer, and especially every dairyman, will find a message of vital interest in this booklet! ***Write today.***

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

LIBRARY

Fort Atkinson, Wisconsin Volume LXI, No. 19 May 27, 1921

89 cents a day-

A FARMER of Mound Valley, Kansas, recently replaced his old cream separator with a De Laval. Immediately, with the same amount of milk, his cream checks jumped from $1.37 to $2.26 per day—89c a day gain, or $324.85 a year.

This is only one instance of thousands where a De Laval has checked waste and added to its owner's profits. You may be losing even more than this; you may be paying for a De Laval and not getting it by using a cream-wasting separator or by hand skimming.

There never was a time when a De Laval Separator would pay for itself sooner, or when it would make you more money than now. There are over 2,500,000 De Laval Separators in use the world over, because they save the most cream and serve the longest time.

See your De Laval agent now about getting a new De Laval—or write us for full information. The De Laval Milker, like the De Laval Separator, is a quality product. Send for full information.

THE FARMER AND HIS BUSINESS

M. H. WATSON, KANSAS

WHY is it that no one is satisfied with his business? The lawyer admires the life of the farmer. The soldier admires the life of the merchant. The farmer says, "Oh! that I had the advantages of the city." And then suppose that these men were given a chance to change. No, they would not do it. They are already following the course for which they are best fitted by Nature or the course of greatest opportunity.

Do these words remind you of something you once read in your school days? Well, it does not matter. They are as true now as they were when they were first written long years ago. You and I are farmers. Shall we examine the charges which we make against our business? We will probably go on farming all the rest of our lives anyway and it would be a splendid thing if we could be happy, enthusiastic farmers.

I am ready to take down the complaints: "The returns are too meagre", "The farm is no place for an ambitious man", "The sacrifices and hardships are too great", "Physically the farmer is almost worked to death and there is little chance to develop some of his other faculties", "The farmer lives an unsocial, selfish life, doing little for anybody but himself and his family", "Everybody imposes on the farmer. He carries on his own poor back the burden of civilization. Some day his back will break and then down goes everything".

Have you ever heard or made any other charges? I would gladly add them to my list. On account of the indiscriminate way in which the charges were poured in upon me, I will draw them out in any order I choose and when I am through you may check them up if you care to, and see whether I have slyly evaded any of them.

Hardships and Sacrifices

First let us see about the hardships and sacrifices. "The farmer is a working man. He wears overalls". Are overalls a hardship? Not to me, if they are respectable overalls. "He must face the elements heat, cold, rain, snow, mud." A vigorous man would rather meet these things than endure close confinement in a store or office. Better for him, too. "He is so closely tied down to his work." Between morning and evening chores, he is freer to spend his time as he chooses than most of his equals in other walks of life. "He seldom hears a good lecture or sees a good play". Yes. "And a visit to the old family home back East has already been postponed too long". I understand. "And there are daily self denials that his family must make." Well, it is idle for us to contend in an honest discussion of this matter that the farmer has no hardships to endure, no sacrifices to make. The average farmer is not a pampered weakling shielded from all that is hard. But he is a real man and he carries a man's load. Many of the things that are grumbled about are trifling and unimportant. The real sacrifices can be made courageously, willingly. We can take satisfaction, even pleasure, in standing where our strength is being tested. In later years, as we look back over the road that we have traveled, the hardships we have endured will strengthen and cheer us.

Making the Man and His Business Fit

It is the unused and undeveloped powers of a man that do more than any other one thing to make him dissatisfied with his work. I would suggest two remedies for this: First: strive to so arrange and modify your farming that as the years go by your business will become more and more nearly an ideal business for you. In this respect a farmer is a very independent man. I doubt whether any other profession is quite as free to choose and specialize. If you know what you want and persevere you can do much to eliminate the unsatisfactory things and develop the things in which you are most interested.

IVAN HUFFMAN OF INDIANA CULTIVATING 16 ACRES A DAY WITH A TRACTOR

My second suggestion is that you should have a hobby. If you are of a mechanical turn you ought to have a good little shop well supplied with tools. At times you can get away from your cares and the things you do not like and do some cabinet work or clock repairing or blacksmithing. If you are something of an athlete and understand the games, it might be your side-issue to keep in touch with baseball and football. Read all you can about them and go to see a real game once in a while. May be you can do a little coaching at your local high school. Music is a splendid hobby for some men, especially if a good choir or band can be kept up. You understand what I mean, don't you? Have some small, secondary employment that will supplement your real business and make you enjoy your real business better. In times of care and stress it will give you rest; in times of dullness and monotony it will help you to be cheerful.

The Farmer and Society

Is the farmer selfish, doing nothing for anyone but himself and his family? He sometimes feels he does too much for society, produces most everything, and gets small pay for doing it. And then, at other times, when he is looking at the matter from a little different angle he says to himself, "I'm so tied down by my business that I don't do much for anybody." The world has such great unsupplied needs that we ought to contribute all of our time and money that we can spare. We ought to contribute a little, even if we can't spare it. There is another reason why we ought to give. We cannot live wholly for ourselves and be happy.

Does everybody impose on the farmer? No. That is mostly talk. We all take advantage of the law of supply and demand in our buying and selling and we have no right to complain when others do the same. Natural conditions and our own unsystematic buying and selling often spoil our markets. There is profiteering and there is manipulation of markets, but the remedy for most of our economic evils can best be worked out not by the government but by ourselves.

The Returns

And now we come to the meagre returns. We do have lean years and hard times. We will admit that. But consider the good things of life that we enjoy. We live out of doors in a beautiful world. Our lungs are not lined with a coating of coal soot. We have good water to drink, sleep well at night, have the best of milk, butter, eggs, fruit, and vegetables. Who has a better chance to enjoy his children than the farmer? Those little boys that wear out overalls and shoes with such alarming rapidity would as gladly go to town with father in the wagon or take a ride with him on the plow as do the most delightful thing your imagination could suggest. They live in a fresh, bright world, full of love and confidence, and they are eager to share it. Life can offer things that are covered with more tinsel, but has she anything really better than the simple joys that are a part of a farmer's reward?

Farming is not a get-rich-quick enterprise. Large fees, fabulous profits are not to be expected. But a well organized farm has many sources of revenue and these do not all stop immediately when the farmer lays aside his work temporarily for sickness or rest or pleasure. The faithful farmer may look forward with a good deal of confidence to a comfortable and dignified old age.

Farming has many problems to be solved. Some of these will be solved, not by the experiment stations and the agricultural press but by the common farmers. There are co-operative movements under way which need leaders of all ranks. Many of these leaders ought to come direct from the farms. Some of the social and spiritual needs of the farmers can be best understood and ministered to by their fellows in the ranks. There are places of importance in our national councils that will be filled by representatives from the farms. If the opportunity for distinguished public service may be regarded as one of the returns of a business, we must crowd this also into our list of "meagre returns".

Persistent Growth

There is no better way to make your business interesting than to keep it steadily progressing. Add a much needed building this year and a few pure-bred cows next year and some hog-tight fence the next year. Keep your work up in better shape this year than you did last. Do a better job of book-keeping and farm cost accounting than you ever did before. Cut away a little of the old mortgage and reduce your burden of interest charges. Surely a man who would follow this idea year after year would be both successful and enthusiastic. He would be respected by his neighbors and by himself. A winning player usually enjoys the game. And business is a game, a very interesting one.

I think I can hear someone say, "I would be very glad to build a new

(Continued on page 802)

World's Largest Testing Association

THE Ferndale Cow Testing Association located in Humboldt County, California, is not only the largest cow testing association but is also one of the oldest in the United States to continue in successful operation.

J. W. Coppini, a successful Jersey breeder, is the secretary-manager of the association, and to his good management no little credit is due. The association has now started on its 13th year. Mr. Coppini states: "To the efficient work of the testers is due in a great measure the success of the association." The testers are C. A. Casanova, now on his eighth year with the association; Bruno Kaehler, now on his sixth year; and Carl Helgested, now on his fourth year.

This association tested as many as 4,546 cows last year and 106 members, owning from 2.to 150 cows, finished the year's work. Twenty herds comprising 532 cows were either sold during the year or discontinued testing; 4,014 cows finished their year's work with an average lactation period of 9½ months and with an average butterfat production of 334.03 pounds per cow. There are but very few associations anywhere that can equal this average production, and none that can both approach it in number of cows and height of production: 17 herds averaged from 400 to 495.76 lbs. per cow; 19 herds, from 350 to 400 lbs.; 38 herds, from 300 to 350 lbs.; 23 herds, from 250 to 300 lbs.; 6 herds, from 213 to 250 lbs.

These six low herds were all herds on test for the first time, and had not had a chance to cull out and breed up as had many of the other herds. The high cow of the association, "Speck", belonged to Nate Hauck, and produced 728.95 lbs. of fat. Seventeen cows produced over 600 lbs. of fat; 98 cows, over 500 lbs.; 628 cows, over 400; 1,541 cows, over 300 lbs.

Owner	Number cows	Ave. lbs. fat per cow
Nate Hauck	18	495.76
Peugh Bros.	2	495.26
Chris Diedricksen	8	479.80

L. J. Lindrum	43	400.30

HOW UNCLE SAM IS USING SCIENCE TO INCREASE THE NATION'S MILK SUPPLY

These eleven Holstein cows are probably the biggest milk producing eleven ever lined up side by side. They give an average of 20,000 lbs. milk apiece in 12 months, or a total of 220,000 lbs.

Herds producing an average of 400 pounds or over are shown in the accompanying table.

Although not quite in the 400-lb. class, the herd of C. S. Rasmussen made a very creditable average of 371.33 lbs. for 143 cows.

The large majority of the cows considered in this report are grade cows and their high production is directly traceable to the high class purebred sires that have been in use in Humboldt County for many years, and to the raising of heifers from the good cows found by the testing association work.

Of considerable interest is a comparison of the report of 1909 with that of 1920. In 1909, 581 cows finished their year in the association with an average production of 251 pounds of fat. This year the average of 4,014 cows was 334 pounds, a difference of 83 pounds of fat per cow. Based on the number of cows finishing this year that difference means a total of 333,162 pounds of fat, which, at the price of 70c per pound, the average price paid Humboldt County dairymen in 1920, amounts to $233,213. Even at present prices of 40c per pound for butterfat, this increase in average production means $133,264 per year to the 106 dairymen in the association, or an average of over $1,250 per year per man, as a direct result of cow testing association work.—C. V. CASTLE, Utah.

Freight Rates Are Part of Farmers' Troubles

THE address of Edgar Clark, Chairman, Interstate Commerce Commission, delivered before the executive committee and delegates of the American Farm Bureau Federation, Washington, D. C., April 15, 1921, contains information which is valuable for understanding our problems. He said:

"Industries are entirely inter-dependent. If the Florida man did not grow oranges, the railroad in the orange belt would be of no value. It he did not have the railroad, his orange tree would be of no commercial value. These matters must be considered not only from the standpoint of the present—the question of the movement of the crops of this year, but next year and future years must be considered. It is in the interests of the railroad that the fruit grower and the farmer should raise the largest crops possible, and should find a market for these crops. It is in the interests of the growers that there shall be efficient, well equipped railroads, able to provide a reasonable, adequate service when needed.

"The California lemon grower is unable to sell his lemons in the East at prices that will pay him to produce, pack, and ship his fruit. At first he blamed the freight rates, but as he looked further into the situation he found that the reason for this is the fact that the Sicilian lemon growers were selling their lemons in this country at $1.25 per box. That Sicilian grower has this advantage—he can take that $1.25 in our money back to Italy and it immediately is changed into a $5.00 bill. So in this particular instance the only way in which the California lemon grower can successfully compete is through the levying by Congress of an import tax that will give him a reasonable degree of protection. Then it may be that within a few years or a short time it will be possible to reduce that import tax.

Transportation Rates Not Only Clause

"I don't want to be understood as saying that I favor the growers taking advantage of the consumer. That isn't the great difficulty. The difficulty is the wide difference between the price that the grower gets and the price that the consumer pays. We have made it our business to inquire considerably out of our line in order to get a correct understanding of the situation.

"The facts are that the retail dealer in New York is paying just one-half what he paid last year, but his price to the consumer is identical with that of last year. Obviously the freight rate in that case is not what is preventing the grower from getting the price he got last year, and under those conditions we do not see where a reduction in freight rates would benefit the grower. This is because those who control the market will not pay any more than they are compelled to pay.

"The farmer is back to almost prewar conditions so far as the price he gets for his wheat is concerned, but we are paying the same price for the same loaf of bread.

"I venture these things to show that all of the trouble does not lie with the freight rates.

How Your Freight Bill is Divided

"Some things have been learned from the experiences of recent years with regard to the question of transportation. The serious war conditions were the cause of largely increased expenditures for operation of railroads, including very large increases in compensation to their employees. Before the war the general average of operating expenditures was in the neighborhood of 65% of the revenue—somewhere between 65% and 70%. Now it is a little over 92%. When I say the operating expenses I mean the actual expenses paid out for the operation of the railroad—the more substantial items being wages of employees, fuel, maintenance of way, maintenance of equipment.

"As soon as the railroads were taken over by the government during the war the operating expenses began to climb. The question of compensation of employees came up. A commission was appointed by the director-general, and it recommended increases that aggregated very large sums of money, and these increases were retroactive for some time before the decision was handed down. Shortly before that the director-general made what might be termed a 20% increase in rates. This was effective about half of the year, and the increase in wages was effective throughout the year. The result was a deficit. The increase in wages went on, but no further increase in rates was made, with the result that the government paid out of the treasury large sums to make up the deficit in the course of operating.

"After the return of the railroads to the owners there was a period of six months during which the government guaranteed them against any heavier losses, and it was understood by everybody that there would be a general readjustment in the rates. That was undertaken in a careful, methodical way. At first it appeared that there would be no occasion for increase in passenger fares, but an increase of 30% in freight rates which would produce the desired revenue. However, after careful consideration, more increased wages were awarded, which necessitated recasting figures and increasing passenger fares.

Half of the Roads Can't Earn Dividends

"For the first two or three months after these rates became effective it looked as though everything would work out as had been anticipated. Then for some reason or other the volume of business began to drop off and the ratio of expenses to income began to increase, and that condition has progressed until at the present time about 90% of our gross revenues is expended in operating expenses. There are not more than ten, and perhaps not more than six, individual roads that are earning the interest on their bonds. About one-half of the railroads are at the present time failing to earn their operating expenses and taxes.

"During the year ended December 31st, 1917, a little over 42 cents out of every dollar earned by the railroads was paid in compensation to employees. The amount thus paid during the year ended December 31st 1919, was 42 cents and during the year ended December 31st, 1920, 6 cents."

SPARE THE FLOWERS!

Withhold the devastating torch, that fires the forest bowers and sears with blighting, black'ning scorch the tender, op'ning flowers. Guard well the fragrant blossoms rare, of ev'ry rainbow hue, the ferny fronds and grasses fair, that bend with morning's dew. Disturb not springtime's songsters sweet, or wood-bird's cozy nest; the wee wren's sylvan, safe retreat let nothing cruel molest. Preserve God's glorious gardens green, unharmed by vandal hand, mar not a peaceful rural scene, in all the sunny land.

O ye who gaily wend your way, through forest, field, and glen; who spend the blythesome summer's day, far from the haunts of men, heart-cherish and in love protect kind Nature's varied charms, save them from thoughtless man's neglect and ev'rything that harms. Lest when ye come this way again, to view these places fair, ye find green groves and bush and fen, all birdless, bleak, and bare. That little children, following you, may through life's leisure hours, share lavish Nature's treasures, too: Please, tourist, spare the flowers!

Wisconsin. **A. S. Alexander.**

All Vermont Herds Tested In Eight Years

$200,000 Annual Appropriation Makes Possible Rapid Progress of Tuberculosis Eradication Work

VERMONT has a bovine tuberculosis eradication program which will test every herd in the state for the disease within eight years. Commissioner of Agriculture E. S. Brigham, who has led in the aggressive measures which the Green Mountain State has used against tuberculosis among its cattle, makes this estimate on the basis of the $200,000 annual appropriation voted by the legislature for this work in March. March 1, 1921, there were in the state 363 accredited herds containing 7,061 cattle; 1,361 herds containing 21,347 cattle had successfully passed one test; 2,234 herds with 39,241 cattle were under supervision; and 13,598 head in 1,154 herds were on the waiting list.

Vermont strongly favors state-wide use of tuberculin. The almost unanimous vote of the legislature for the appropriation bill is pretty generally echoed among the owners of cattle. Sentiment has not always been so favorable, however. Several years ago when Commissioner Brigham inaugurated his campaign against the disease, he met vigorous opposition, particularly when he ruled that no cattle could come into the state without first being tested—and then enforced the rule.

Much educational work has been done and the attitude of many has changed. In one instance a cattle owner who once led the opposition to appropriations for this work is now one of the strongest promoters of the test. Men who formerly lobbied against the state's subscribing to a measure which they testified was ruinous to the cattle industry now declare that the test is necessary before their cattle have selling value.

The Vermont policy has been against compulsory testing; no law requires that a herd shall be submitted to tuberculin examination. However, it is rapidly becoming true that the market demands tested animals; that a man may own an untested herd but he cannot find a buyer.

Application for Test

Before indemnities are paid for reacting cattle the owner must sign an application-agreement which necessitates continued effort to keep the herd clean, and which guarantees that the appropriations are used to advantage. For example, a man cannot receive payment from the state for reactors without testing his whole herd. Also, where indemnities have been paid, recovery can be made by the state if specified regulations are not carried out. The "terms" of the application are:

1. I will permit my entire herd, or any cattle of my herd, to be examined and tuberculin tested or retested at such times as considered necessary by the bureau or state officials.

2. I agree that no cattle shall be presented to the tuberculin test which have been injected with tuberculin within 60 days immediately preceding or which have at any time reacted to a tuberculin test.

3. If any of my cattle are condemned as a result of reaction to the tuberculin test or from physical evidences of tuberculosis, I agree to bear all the expense of slaughtering and disposing of such animals if they are slaughtered on my premises, or, if directed to do so, I will, at my own expense, drive such animals to my nearest railroad station, load them on cars, and bill the shipment as directed by the Commissioner of Agriculture of the state of Vermont, or his agent. This shall not be construed, however, as a waver of my right to hold reacting cattle for breeding purposes, as allowed in Section 505 of the General Laws.

4. I hereby agree to accept in full payment of all indemnity for cattle found diseased the amount authorized by the laws of Vermont.

5. I agree that all milk and other dairy products fed to calves in my herd shall be that produced by an accredited herd or, if from outside or unknown sources, it shall be pasteurized by heating to not less than 150° F. for not less than 20 minutes.

6. I will allow no cattle to be associated with my herd which have not passed a tuberculin test approved by the bureau or state officials. I will keep all new cattle separated from my herd, pending the application of a tuberculin test by an inspector of the said bureau or state or by a veterinarian authorized by the inspector in charge of tuberculosis eradication work in the state. I will notify the proper officials immediately, giving details of the identification, characteristics, and records of tuberculin tests of any cattle which may be added to my herd.

7. I will surrender any premises contaminated by tuberculosis animals, as indicated by a physical examination or a tuberculin test, to a thorough cleaning and disinfection, at my expense, under the direction or supervision of the bureau or state officials. I will comply with all reasonable sanitary measures and other recommendations for the control of tuberculosis.

8. When pure-bred or grade herds under this agreement have qualified in accordance with the "uniform methods and rules for tuberculosis-free accredited herds of cattle", they will be entitled to be placed upon the accredited register of the Bureau of Animal Industry, United States Department of Agriculture, and of the Department of Agriculture of the state of Vermont. Herds so qualifying will be classed as officially Tuberculosis-free Accredited Herds so long as the conditions enumerated on the back of this agreement are met.

(The conditions are those unanimously adopted by the United States Live Stock Sanitary Association and by representatives of pure-bred cattle breeders' associations, and approved December 23, 1917, by the United States Bureau of Animal Industry, with amendments adopted December 3, 1919.)

All three tuberculin tests are used, the subcutaneous, interdermic, and ophthalmic, depending upon the conditions under which the test is made. Increasing use is made of the interdermic because of the rapidity with which it can be applied.

Concerning the indemnities paid by the state, Commissioner Brigham says:

"We shall operate under our present law until June 1, 1921. This provides that the limit of appraisal for reactors is $100 for each grade animal and $150 for each registered animal. The state has the salvage and the state and federal governments pay 75% of the appraised value.

"On June 1, 1921, we shall operate under a new law which provides that the owner may dispose of reactors through licensed dealers to licensed slaughter houses where the animals are slaughtered under federal inspection, or he may dispose of them directly to such slaughter houses without the employment of dealers. The salvage will go to the owner and the state and federal governments will pay two-thirds the difference between the salvage and the appraisal value. The appraisal value will be subject to the limits above indicated."

Do You Want a Herd of Cattle Free from TUBERCULOSIS?

The STATE OF VERMONT and FEDERAL GOVERNMENT Will Help You

WHAT THE STATE AND FEDERAL GOVERNMENT WILL DO TO HELP YOU.

1. Send a competent veterinarian to your farm free of charge to apply the tuberculin test to your herd at least once a year until it has passed two tests without a reactor.

2. Appraise any of your animals reacting to the test at their market value, with a limit of $100.00 for each grade animal and $150.00 for each registered animal and pay you 75 per cent of such appraisal.

3. Send a competent inspector to supervise the cleaning up and disinfection of your premises if tuberculosis is found in your herd.

4. When your herd has passed two annual or three semi-annual tests without a reactor, it will be placed on the accredited register of the State and Federal Departments of Agriculture. You will receive an accredited herd certificate and cattle from your herd may be shipped interstate without further test for a period of one year.

5. Your herd, when accredited, will be listed in a booklet published by the U. S. Department of Agriculture and sent to all parts of the country. Buyers of tuberculin tested cattle will seek out your herd.

WHAT THE STATE AND FEDERAL GOVERNMENT WILL REQUIRE OF YOU.

1. That you submit your entire herd to examination and test at such times as are considered necessary by state or federal officials.

2. That you will allow no cattle to be associated with your herd which have not passed a tuberculin test approved by State or federal officials.

3. That you will thoroughly clean and disinfect your premises, if tuberculosis is found in your herd, under the direction of state or federal officials.

4. That all milk or dairy products fed to your calves shall be from cows which have passed an approved tuberculin test or shall be pasteurized by heating to not less than 150 degrees F. for not less than 20 minutes.

5. That you transport the veterinarian assigned and the inspector sent to supervise disinfection of your premises from the railroad station to your farm and return or to a neighboring farm if desired.

6. That you slaughter on your premises or drive to railroad station, load on cars and bill out any reactors found in your herd as directed by state or federal officials.

World's Largest Co-operative Creamery

J. A. Ruddick, Dairy Commissioner in the Canadian Department of Agriculture, furnishes information with reference to the production of New Zealand's creameries. Mr. Ruddick supplies these figures following a statement in Hoard's Dairyman some weeks ago that the co-operative creamery at Barron, Wis., is the biggest of its kind.

He shows that several co-operative New Zealand creameries exceed the output of the one in Wisconsin. Two of the largest of New Zealand's creameries are each producing over 1,700 tons of butter annually; that is, over 3,000,000 lbs. each. The heaviest output of the Barron creamery was 1,805,694 lbs. in 1920. The average of the eleven largest creameries in New Zealand is an output of 723 tons per year or 1,446,000 lbs.

The largest cheese factory in New Zealand last year produced 2,000,000 lbs. of that product and the next eleven largest averaged 1,288,000 lbs. In 1920 there were 153 creameries and 384 cheese factories in operation in New Zealand being a reduction of six creameries and four cheese factories as compared to 1919.

Gertie's Marjorie Glynllyn, owned by A. M. Hellings, is the new champion Jersey cow for her age of New Jersey. This Jersey produced 10,483 pounds of milk and 626 pounds fat, starting test at three years and three months of age.

Wisconsin's Champion Jersey

R. S. HULCE, WISCONSIN

WISCONSIN'S State Jersey butterfat record is 759.17 lbs. The cow holding the record is Trinket's Ebony L owned by K. T. Wiegand.

Mr. Wiegand took the short course in agriculture at the Wisconsin College of Agriculture several years ago and is today successfully conducting a dairy farm on an up-to-date business basis.

Trinket's Ebony L, from the standpoint of type, is a real dairy cow. She has three Register of Merit records all made in class AA. Her best record and the one entitling her to first place among the Jerseys in the state is 14,112.2 lbs. of milk containing 759.17 lbs. of fat made at 6 years and 5 months of age. While making this record, she had the use of a box stall for two months of the test and the remainder of the year occupied a stanchion alongside the other members of the herd.

Seven hundred pounds of fat is a large production for any cow.

Trinket's Ebony L has two other yearly records sufficiently good to make her prominent. Her daughter in milk has a production of 510.86 lbs. of fat at 2 years and 1 month of age, good evidence that Wisconsin's champion Jersey is not only an extremely good producer but a good reproducer as well.

Trinket's Ebony L was sired by Winnie Pedro's King and he in turn by King Sappho King. Her sire is a half brother to King Sappho Climax, the sire of the University of Wisconsin cow, University Kenna Climax, which has a yearly record of 746.76 lbs. of fat. It is a matter of regret to note that Winnie Pedro's King was sold for beef before any of his daughters were tested. His daughters have made fourteen records which average 548.4 lbs. fat.

TRINKET'S EBONY L, AT THE LEFT, AND HER SIX SISTERS
The seven have records averaging 10,720 lbs. milk, 555 lbs. fat.

Trinket's Ebony L and six of her sisters were a part of an exhibit at the 1919 Wisconsin State Fair, to show the value of using good sires. The exhibit was planned and was in charge of A. J. Cramer who is in charge of Wisconsin cow testing associations. The average yearly production of the seven cows was 10,720 lbs. of milk and 554.8 lbs. of butterfat.

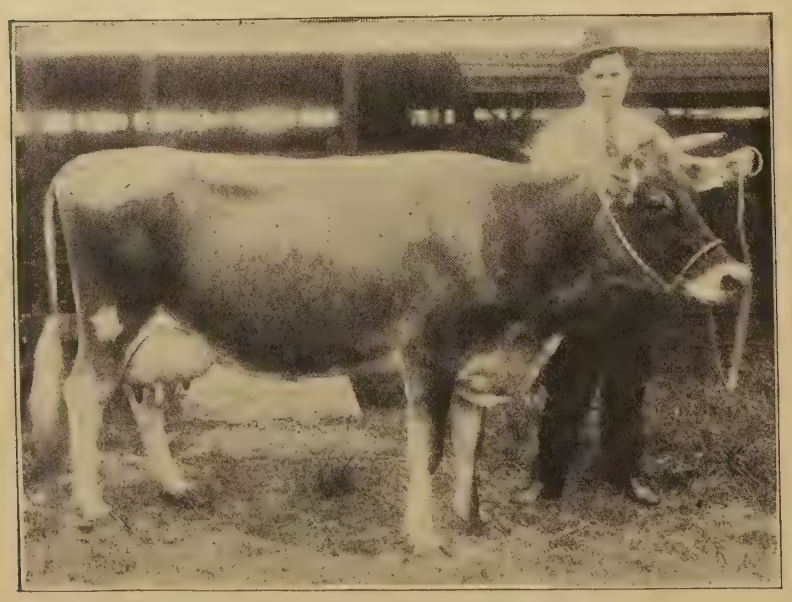
Mr. Wiegand says of Winnie Pedro's King, "All of his daughters are strong cows with good quality, excellent udders and teats; they are easy milkers and good reproducers." What is such a sire worth to any breed? Without trying to answer the question, we can with pride point to Trinket's Ebony L and to the productions of her sisters.

Cottonseed and Linseed Meal Markets

SANDERS SOSLAND, MISSOURI

GOSSIP on markets reports "abnormal strength in the trade in cottonseed cake and meal". Handlers of other high protein feeds comment on the fact that "linseed cake and meal are extremely weak". Presumably the turn has come in the market for both of these important concentrates. Not so long ago the declining course of prices for cottonseed cake and meal was proceeding at a rapid pace, while the flaxseed by-product was commonly termed the strongest feed on the market, with the quotations far above a parity with other feedstuffs. Yet there is no distinct surprise over the reversal in the price movements. The trade is seeking light as to how far the changed trend in fluctuations will extend.

The position of the market for cottonseed cake and meal is uncertain. Export operators at the Gulf ports have provided the buying power in recent weeks that brought about the advancing tendency of prices. From the bottom level of the early weeks of April, the high protein feed has advanced $5 to $7 a ton. Prime cake and meal of 43 per cent protein content is now quoted around $26 to $27 a ton in Texas, about $25.50 to $26 in Oklahoma, and about $27.50, basis Little Rock and surrounding Arkansas points. Loose slab cake, the grade bought almost entirely by foreigners through their brokers at the Gulf, has recently sold up to $24 a ton in Texas and on a freight parity in other producing states. Even cold pressed cake, which has lagged more or less because of the abundance of rough feeds, is being held around $20 a ton in Texas and Oklahoma, more than $4 above the low point. During the same period linseed cake and meal have declined abruptly from a level around $43 a ton, basis Minneapolis, and about $45 to $46 at eastern export points, to approximately $27.50 to $29 at the northwestern producing center and about $30 at Buffalo and New York.



Before the bulge in linseed cake and meal to about $43 a ton in Minneapolis territory, prices had previously declined to around $35 to $36. The entrance of foreigners into the market, as in the case of cottonseed feed at the present time, created the bullish motive. For this reason, the trade is inclined to doubt whether the display of strength in the by-product of cottonseed mills is permanent. On the other hand, observers of the market recognize that the maintenance of buying by exporters at the Gulf can easily force a further sharp advance in prices, and it is common to hear that slab cake will soon be soaring above $30 a ton in Texas territory. The supplies of cottonseed cake and meal in domestic channels are extremely light, new production is limited, so it is apparent that no enormous power is necessary to maintain a strong position in these protein feeds.

Foreign buyers have been accumulating stocks for May, June, and even July shipment from the Gulf. No information is available as to the extent of the requirements of the Old World. The trade has only to guide itself in the action of the exporters in the linseed feed market. After forcing a sharp upturn, the result of heavy buying, they suddenly dropped out, the flaxseed feed having soared too far above a parity with cottonseed feed. Now the latter product, on the basis of about $32.50 to $33 a ton at the Gulf, is fully $3 above linseed feed at the Atlantic coast ports. Operators in feedstuffs markets and in other commodity trading, including the wheat market, have come to appreciate that the alert foreigners do not continue to "put up the market on themselves". And it is considered improbable that they will continue a powerful buying force in cottonseed cake and meal. This belief is strengthened by the fact that this is ordinarily not the season for heavy buying of cake and meal by Europe.

As to the domestic demand, the situation in cottonseed cake and meal and linseed feed is not unlike that of other products used in feeding operations. The demand is extremely light. The linseed feed trade is almost dormant, and even the extremely light production of northwestern crushing plants is more than is required by the consuming trade. Dealers are slow to take hold, recognizing the reluctance of feeders, and they are buying on a hand-to-mouth basis in very small quantities. The range trade in cottonseed feed, normally an important outlet for offerings, is virtually out of the market. Manufacturers of commercial fertilizer who, during the war, bought enormous quantities of meal are again receiving liberal quantities of potash from Germany and other sources, and consequently are taking negligible quantities of the feed. Commercial feed mixers manifest a lack of interest in the high protein feeds, attributed entirely to the almost stagnant demand for the so-called balanced ration commercial feedstuffs. Feedlot cattle operators in the central states, who are feeding corn generously, are moderate buyers of cake and meal, but this is the only domestic demand of importance.

Without foreign demand, it is therefore apparent that the market cannot maintain strength on cottonseed feed. This already has been demonstrated in linseed cake and meal. Of the two commodities, however, it seems that cottonseed feed is in the strongest position. Even on the basis of the advance in prices, no feed on the market offers protein units at as cheap a level as prime cottonseed cake and meal. A friendly attitude toward cottonseed cake and meal is advisable also because of the possibility of the entrance of grass cattle operators into the market for large quantities of cake with which to hasten maturity and to develop a harder finish on their stock. Still, the position of the cattle market is more or less discouraging to cattlemen and does not point to important buying for grass feeding activity. There was virtually none of this buying a year ago, and cattle today are considerably lower than at this time in 1920. The excellent condition of pastures over most of the country, too, is against this. Weather conditions, of course, should play an important part in the market movements.

Linseed cake and meal, it seems, have not yet struck bottom. The price is yet too far above a parity with corn to stimulate domestic demand and with the utilization of pasture spreading, buying power may fall off further. On the other hand, the trade should not overlook the light stocks in hands of the distributing trade, though this is offset in a measure by moderate accumulations at crushing plants. Production by flaxseed mills is being stimulated somewhat by the freer movement of linseed oil.

LOUISIANA JERSEY MAKES NEW HIGH RECORD

Golden Bar's Foxy Lass, a Jersey cow owned by A. J. Price, Louisiana, has completed a new high record for Louisiana, by producing in one year 12,955.8 pounds of milk, 686.65 pounds of fat. This is the highest official record that has been made by any dairy cow in the state.

Golden Bar's Foxy Lass is not the only good cow in Mr. Price's herd. He has 25 cows on official test, some of which are pushing the winner for state honors. Among these are Gussie's Foxy May with a record of 639.96 pounds of fat and Gussie's Dame Virginia which holds the state record for a three-year-old cow, with 456.29 pounds of fat. The herd's work is a demonstration that large production records of milk and butterfat can be obtained with good dairy cows in Louisiana when they are given the proper treatment.

Planning for the Silo

FRANK M. CHASE, KANSAS

NEWT Perry was a new member of the Cedar Valley Cow Testing Association. Having made his start in farming during the war, he was attracted by the big prices for grain and produced corn, wheat, and oats almost exclusively. After swallowing some heavy losses in the price smash of 1920, however, he decided to engage in a line of farming less hazardous as to both weather and markets, finally pinning his faith to dairying.

During the winter he had gotten together a respectable herd of grade cows, while the Better Sires Campaign, hitting his community at the psychological moment, caused him to place a registered bull at its head. For the time, his dairy equipment lacked just one important thing: he had no silo. This shortcoming the tester, Harry Kent, had noted the very day that Newt hailed him at the roadside to ask whether the association could take in another herd. To have a member of the association without a silo immediately became a challenge to Harry, and he decided on the spot to spread a little silage gospel at his first opportunity.

The warm days of an early spring had caused much discontent in the Perry herd. After a winter of dry hay and of dry grain feeds, the longing for the tender blades of grass, the warm, fresh air and freedom from stanchions grew stronger daily until, because of it, the milk flow was dropping seriously. This situation was bothering Newt a good deal when Harry made his first stop at the new member's. At the evening milking the production seemed lighter than ever, and the two men had scarcely left the barn after the chores were over before Newt put his problem before the tester.

"Most of my cows were fresh in the fall," said the proprietor, "and I was hoping that when warm weather came they would begin to increase their production a little. Instead their milk flow is falling off. Why is that, and what can I do to keep them from drying up entirely?"

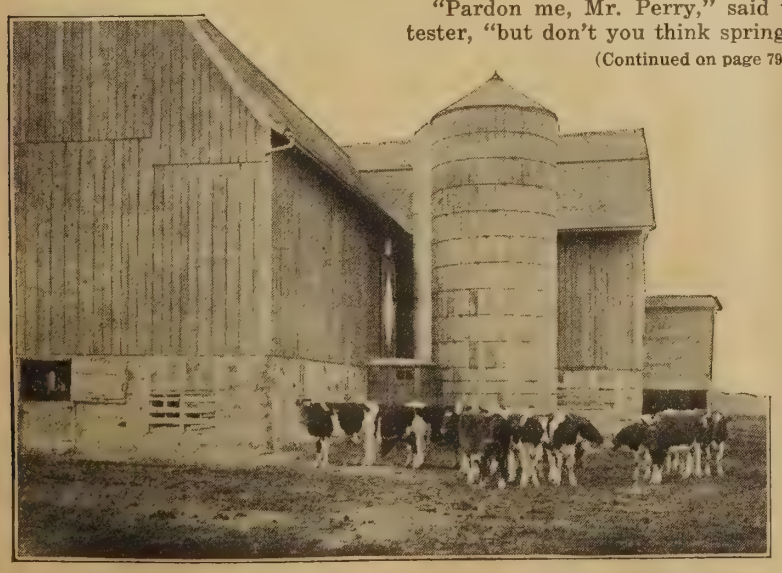
"Your cows have a bad case of 'spring fever', Mr. Perry," Harry said. "They want grass and to get out of their cramped winter quarters. They have been wanting these so long and so much that they have grown restless from it, and this impatience is being reflected in the milk flow. I noticed you digging into those greens that Mrs. Perry had for supper as if they tasted pretty good. Cows, you see, have the same liking in the spring for green grass and something different from the winter rations that they have had so long."

"But I can't turn the cows out to pasture now," said Perry. "They'd ruin it with their tramping. There isn't much grass yet anyway."

"Certainly not," replied the tester. "The fact of the matter is that there isn't much that you can do now to help the situation. Often a change in the makeup of the ration, so as to make it more palatable or at least give it a different taste, will help some; I'll see what I can do about that before I leave. Then you can let the cows remain in the lot the greater part of these warm, sunshiny days, give them an extra good bed at night and try generally to make them as comfortable as possible. This helps to keep them more contented, even if they can't have the grass that they want so much.

"The big thing in handling spring slumps in the milk flow is to prevent them. After they have come the cows usually do not pick up a great deal until they actually are on green feed, and then don't increase their production as much as they would if the slumps never had occurred."

"How can these slumps be prevented?" asked Newt. "Believe me, I'm going to do it another year, if I can."



"As I said," the tester continued, "extra good care during the spring season and perhaps a change in the ration to increase its palatability will help a good deal. But that is far from all. The best preventive against spring milk slumps is silage. This is because cows that have this succulent feed all winter, of which they seem never to get tired, don't crave green feed in the spring so much as those that have been on dry and less appetizing rations. The cows, therefore, are less uneasy to get to pasture. You yourself, for instance, would be craving greens and vegetables far more than you do at this season if it was not for the fact that Mrs. Perry's shelves of canned fruit have supplied you with such food during the winter. The silo, you see, is the cow's fruit jar.

"Besides, you need a silo anyway. There simply is no other means by which you can get as much milk from your corn crop, pound for pound of dry matter, as in silage."

"I confess it does rather look as if I would have to have a silo," Perry replied, slowly. "I had put off thinking about it until summer, however. There'll be time enough then to put one up for use next winter."

"Pardon me, Mr. Perry," said the tester, "but don't you think spring is

CEMENT STAVE SILO ON THE FARM OF F. A. LINDER, WISCONSIN

Circle A Cork Brick make stall floors comfortable at the Alta Crest Farms, Spencer, Mass.

Out in the Fields

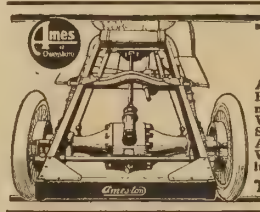
AFTER long months on hard stall floors, it must be a "grand and glorious feeling" when the cows get their feet on the soft, springy turf. Their whole organism is adjusted by nature to that firm but easy footing, and many of their ills are due to the unnatural floors—cold, hard and slippery—on which thoughtless owners compel them to stand and lie.

No flooring material more nearly resembles the yielding turf in "feel" and security than

Circle A Cork Brick
FOR STALL FLOORS

Warm, dry, nonslippery and resilient, the cow's feet are "at home" on such a floor. She steps with assurance, moves with safety, stands in comfort and lies down in security against chill and dampness. Cork Brick are non-absorbent, easily cleaned and remarkably durable. No feature of barn construction will pay you better than clean, comfortable, durable floors of Circle A Cork Brick.

Note:—They can be laid over old floors.



Your name and address will bring you a copy of the 36-page book, "Better Stall Floors." Breeder or dairyman, you will find it a mighty interesting and valuable book to have. No charge whatever.

Armstrong Cork & Insulation Company 112 Twenty-fourth Street PITTSBURGH, PA.

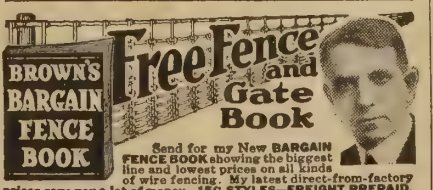
TEAT CUP NEWS

A new principle in teat cup construction with two years of successful service. The action gently massages while suction is applied thus putting your milker in the pipe line class without a pulsator. Our SIMPLE, UNIVERSAL teat cup does the trick. Write for our money back five-day trial offer if your dealer cannot supply you.

FROST ENGINEERING COMPANY, 528 S. Oak Park Ave., Oak Park, Ill.

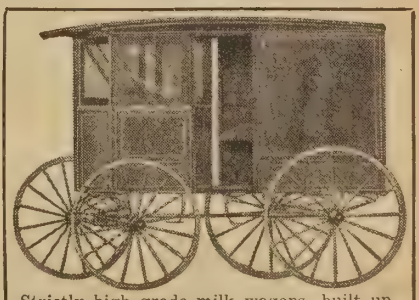
Turn Your Old Car Into a Money-Making Motor Truck With an Ameshilt
Worm Drive Truck Unit

At from 1-5 to 1-3 the cost of any truck of equal capacity, the Ford, Buick, Dodge, Cadillac, Reo, Oakland, Chalmers or Maxwell, or any other make car with transmission amidship can be made into a Guaranteed Worm Drive 1 1-2 or 2 ton truck with an Amesbilt Worm Drive Truck unit. Not a slow, cumbersome makeshift, but a complete motor truck assembly. Save the engine, front axle and side members of your old car—sell the rest. Then bolt on the Amesbilt Truck Unit frame and you have a sturdy, dependable, money-making truck. Worm drive, as used in all best motor trucks. Bears the famous "Ames of Owensboro" absolute guarantee. Saves money and makes money for you. Write for literature and prices.



THE F. A. AMES CO., Incorporated 551 Main Street, Owensboro, Ky.

World's Greatest White Collies



They will herd your stock, guard your flock and rid your place of vermin. A playmate for the children and a household companion. Largest breeders of white collies in the world.

SHOMONT KENNELS
Thos. Shover, Prop,
Dept. D, Monticello, Iowa

Send for my New BARGAIN FENCE BOOK showing the biggest line and lowest prices on all kinds of wire fencing. My latest direct-from-factory prices save you a lot of money. 150 STYLES—FREIGHT PREPAID. We use heavy ACID TEST GALVANIZED wire—outlasts all others. Book and sample to test—FREE by return mail. [1]

THE BROWN FENCE & WIRE CO., Dept. 176 CLEVELAND, O.

Strictly high grade milk wagons, built upon honor and fully guaranteed. Ask for free catalogue showing styles for every requirement. Suitable terms and liberal cash discounts. Pioneers in milk wagon building with sanitary bottled milk equipment. Also builders of metal panel wagons at low prices.

De Kalb Wagon Company,
P. O. Box E, De Kalb, Ill.

Cow Testing Associations

RECORDS, PRICES OF FEEDS, FAT, AND MILK

Following is the summary of reports received during the week and up to the time of going to press of this issue:

Association Notes

Nehalem Valley, Oregon:—Great advancement is being made toward obtaining pure-bred bulls to lead the various herds. The cheese factory paid 73c per pound for fat. Corn sold for $50 per ton; barley, $38; oil meal, $65; mill run, $35.

Monroe, Wisconsin:—The first month has certainly made a creditable showing. The entire membership has pure-bred bulls and, in the number of pure-bred and high grade cows, this association ranks among the highest in the state. Most of the members have their herds tested regularly. Some A. R. O. work is in progress and creditable records are made. Feed and milk prices varied considerably with the average prices for feed as follows: alfalfa, $20 per ton; silage, $7; oats, $30; barley, $30; oil meal, $30—$45; hominy, $28; bran, $20—$30. Due to the fact that the members are so widely scattered and the cheese factory takes a large share of the milk, the milk prices ranged from a flat rate of $1.10 at some cheese factories to $2.35 per hundred for 3.5 per cent milk and 4c a point at the condensery.

Tillamook, Oregon:—Several bulls and a number of cows and heifers were purchased at a sale of Jerseys. Three milking machines were installed and one discarded. The Guernsey breeders held a picnic at the Homer Mason ranch. Several good speakers were present and a good crowd was in attendance.

Porter County Co-operative, Indiana:—A few herds were turned on pasture in April but most of the herds were kept in until May 1st. Several members have their herds under federal supervision for tuberculin testing. Two unprofitable cows were sold and one pure-bred cow was purchased. During April, market milk sold for $2.35 per cwt. The creamery paid 41c per pound for fat. Milk retailed for 15c per quart and butter for 50c per pound. Silage was quoted at $5 per ton; alfalfa, $18; clover, $16; corn and cob meal, $18; corn meal, $21; oats, $24; bran, $30; cottonseed meal, $40; oil meal, $48; gluten feed, $42.

Delaware County, Ohio:—Three unprofitable cows were sold and one on her cow testing record to a former member of the association who sold his seven grade cows for this one pure-bred. Many farmers are feeding grain this spring. The creamery paid 48c per pound for fat. Bran sold for $1.50 per cwt.; oil meal, $2.65; cottonseed meal, $2.50; dried beet pulp, $32.50 per ton; clover hay $10; alfalfa, $15; oats, 35c per bushel; corn, $45c.

Dallas County, Iowa:—Two cows were sold for beef and six for milk. During April market milk testing 3.5 per cent sold for $2.45 per cwt. Five cents were paid for each point above. Feed prices: Alfalfa, $20 per ton; clover, $16; silage, $8; oil meal, $52; cottonseed meal, $48; bran, $36; corn, $35; oats, $26.

Rural, Pennsylvania:—Most of the dairymen have signed the pooling contract of the Dairymen's League. Farmers have been buying their supplies such as stock salt, barbed wire, etc., through the League at a neat saving. Market milk testing 3 per cent is selling at $1.94 per cwt. Feed prices: meal, $1.55 per cwt.; bran, $1.70; linseed, $2.50; cottonseed meal, $2.10; chop, $2.00.

Hennepin County, Minnesota:—Four members tested their herds for tuberculosis last month. Market milk testing 3.5 per cent sold for $2.33 per cwt. Five cents were paid for each point above. Milk retailed for 11c per quart and butter for 40c per pound. Bran sold for $16 per ton; barley feed, $18.50; corn meal, $21; oats, $21; oil meal, $36; silage, $6; clover, $16; alfalfa hay, $20.

West Branch-Tri-County, Iowa:—During April, market milk testing 3.5 per cent sold for $2.80 per cwt. Eight cents were paid for each point above. The creamery paid 43—47c per lb. for fat. Milk retailed for 15c per quart and butter for 40c per pound.

Allen-Putnam County, Ohio:—Nearly every herd is headed with a pure-bred bull. One of the members purchased a fine bull at the state sale. Of the 41 cows that produced over 40 lbs., 10 of them made above 50 pounds. Market milk testing 4 per cent sold for $2.40 per cwt. Four cents were paid for each point above. Milk retailed for 12c per quart; butter for 35c per pound and cheese for 30c. Corn sold for 60c per bushel; oats, 41c; barley, 70c; cottonseed meal, $2.00 per cwt.; oil meal, $2.20; bran $2.05.

Racine and Kenosha County, Wisconsin:—Most members are feeding balanced rations and are securing good results. Four pure-bred cows were purchased during the month. Market milk testing 3.5 per cent sold for $2.35 per cwt. Butter retailed for 48c per pound. Feed prices are as follows: Mixed hay, $20 per ton; corn and cob meal, $20; Unicorn, $50; alfalfa, $25; bran, $26; gluten, $45; oats, $25; oil meal, $46; barley, $26; cottonseed meal, $43.

Wilton, Wisconsin:—Two cows were disposed of over the block. This association has requested legislative support to prohibit the manufacture of bogus condensed milk containing cocoanut oil, etc., and we have received assurance from assemblyman to do so. The creamery paid 53c per pound for fat during April. Milk retailed for 9c per quart. Feed prices: Bran, $21 per ton; middlings, $20; alfalfa hay, $30; oil meal, $45; oats, 35c per bushel; barley, 60c.

Blue Earth County, Minnesota:—Several unprofitable cows were sold and several members purchased pure-bred Guernsey and Holstein females. Herds are being gradually turned out to pasture, but in order to keep up the milk flow, until it is more substantial, grain is being fed. Market milk sold for $2.50 per cwt. The creamery paid 56c per pound for fat. Milk retailed for 11c per quart and butter for 46c per pound. Bran sold for $20 per ton; oil meal, $48; silage, $6; hay, $10—$18; oats, 28c per bushel; corn, 40c.

Richfield, Wisconsin:—During the past month buyers from Michigan, Kansas, and Missouri have taken 3 carloads of pure-bred and grade Holsteins from our association. One member sold two pure-bred Holstein cows and one heifer calf for $700 and another member sold four grades and one pure-bred Holstein cow for $725. There were some unusually high prices here and this is where the testing association played its part. During April, market milk sold for $2.30 per cwt. The cheese factory paid 59c per pound for fat. Milk retailed for 10c per quart; butter, 42c per pound, and cheese, 45c. Bran was quoted at $24 per ton; gluten, $38; middlings, $20; oil meal, $41; oats, 31c per bushel; barley, 70c; corn, $1 per cwt.

Loudoun Valley, Virginia:—About 25 unprofitable cows were disposed of and 6 pure-breds bought this winter, besides several have increased their number of pure-breds from their own raising. During April, 3.5 per cent market milk sold for 30c per gallon. Feed prices are: Alfalfa hay, $30 per ton; clover or mixed hay, $20—$25; cottonseed meal, $36—$43; bran, $35—$40.

Canaan, Connecticut:—During April market milk sold for $2.19 per cwt. Bran sold for $31 per ton; middlings, $30; mixed feed, $33.50; corn meal, $31; ground oats, $37; gluten feed, $49; linseed meal, $48; cottonseed meal, $37; dried beet pulp, $38.50; stock hay, $30; ensilage, $6.

Bourbon County Co-operative, Kansas:—During April market milk testing 4 per cent sold for $2.44 per cwt. and 21c per gallon. The condensery paid 56¼c per pound for fat; the creamery, 35c. Milk retailed for 12c per quart and butter for 40c per lb. Feed prices: Bran, $20 per ton; cot-

This Book on Machine Milking Sent Free

EVERY man who keeps cows and is thinking of getting a milking machine should surely get this book. It gives important pointers. It tells you frankly what you must do at the start before you learn how to milk. It doesn't try to paint everything "rosy". This book is written with the idea that a man must know all the facts about machine milking if he is going to make a success of a milker. To advertise the Page Milker we send this book free. The Page Milker is in various models—Hand Power Gas Engine *and* Electric Power

tonseed meal, $28.50; corn and cob meal, $15; ground oats, $18; silage, $4.

Marshfield-McMillan, Wisconsin:—This association reorganized in April with 26 members. Every member has one silo or more. Two scrub bulls are being used. Six members did A. R. O. testing during the winter. Daily milk records are kept by 14 members. The price for fat for April varied from 34 to 45 cents per pound at the local creameries and cheese factories. Milk retailed at 8 and 10 cents per quart.

Claremont and Lebanon, New Hampshire:—Due to low prices for dairy products, farmers are thinning out their herds, removing especially the poorest grades to make room for pure-bred heifers. At Lebanon the farmers recently got a carload of cottonseed and linseed at a saving of about $10 per ton. During April, market milk sold for $3.50 per cwt. The creamery paid 50c per pound for fat. Milk retailed for 12c per quart and butter for 55c—60c per pound. Bran sold for $33 per ton; cottonseed meal, $37.50; oil meal, $36.50; ground oats, $44; corn meal, $34; middlings, $43; silage, $9; mixed hay, $20.

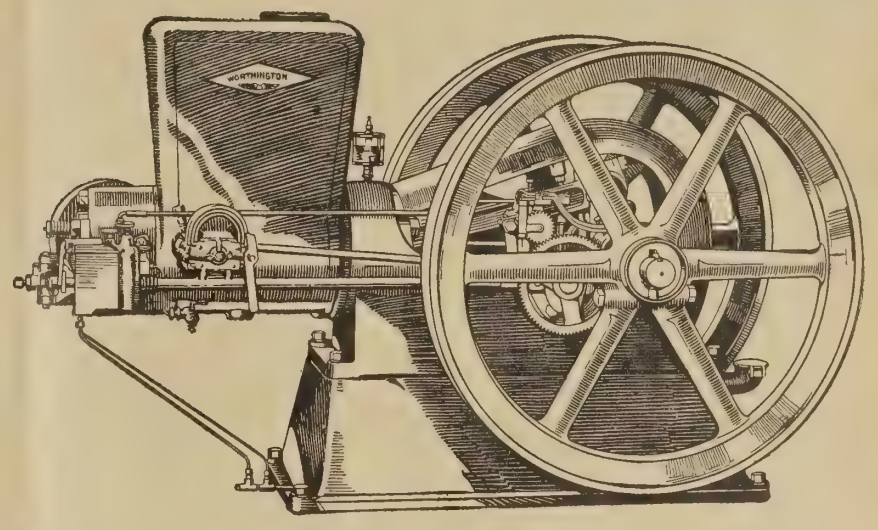
Jamestown, North Dakota:—A cow testing association was organized in the territory tributary to Jamestown the latter part of March. We found some very good cows and hope to increase the number of 40-lb. cows by better feeding methods this month. Cattle are going out on grass now. Some of the association members are selling milk in Jamestown at $2.50 per cwt.; while others are selling butterfat at 30c per pound. Butterfat averaged 44c during April. A few bought oil meal and cottonseed at $3 during April, and the other grains were priced at: oats, 20c per bushel; barley, 35c; corn, 35c; alfalfa, $10 per ton; silage, $6; bran, $20.

Columbia, Oregon:—Since this association became organized eight months ago, 15 unprofitable cows have been disposed of. Nine pure-bred sires have come in the association and three pure-bred Jersey heifers. A large amount of grain feeding has been in practice with good increases in production. The creamery paid 28c per pound for fat and the cheese factory, 48c. Milk retailed for 40c per quart. Cottonseed meal sold for $42 per ton; cocoanut meal, $36; Mill Run, $32; pastures: bottoms, $2; semi-bottoms, $1.00—$1.50; uplands, 50c.

Kent County Co-operative, Michigan:—During April, milk retailed at 12c—13c per quart and wholesaled at 20c per gallon. Butterfat was priced from 49c—50c—60c. Feed prices: silage, $6 per ton; timothy hay, $14; clover, $16; alfalfa, $20; cottonseed meal, $45; oil meal, $50; ground oats, $30; Unicorn, $45.

Southern Berkshire, Massachusetts:—The last grade bull has just been disposed of and the association now stands 100 per cent pure-bred sires. During April, market milk testing 3 per cent sold for $2.21 per cwt. Four cents were paid for each point above. Milk retailed for 12c per quart. Bran sold for $36 per ton; gluten, $38; cottonseed meal, $42; oil meal, $38; corn silage, $8; hay, $20.

Ohio Valley, Ohio:—Two members of this association purchased a pure-bred bull at the Belmont County Jersey Club Sale and are expecting to build up a herd with him. Another member bought a heifer at the same sale and expects to add type and production to his already splendid herd of Jerseys.



Mount Hope, Wisconsin:—In six months the members of this association have disposed of 13 unprofitable cows. Four more members are feeding balanced rations. The creamery paid 49c per pound for fat and the cheese factory, 47c. Milk retailed for 10c per quart. Bran sold for $22.50 per ton; ground oats, $25; oil meal, $47; hay, $16; silage, $7.50; pasture, $1.50 per month.

Darien-Sharon, Wisconsin:—A number of the barns look resplendent in their new coats of whitewash but very few farmers have turned cows out to pasture. One new member with a fine herd of 12 cows, by feeding a balanced ration, has raised his production from 9,187 lbs. milk to 13,112 lbs. Another member, owner of high herd last year, says he could not afford to be without testing if it cost him twice the present fee. A lot of tuberculin testing is being done this spring. Market milk testing 3.5 per cent sold for $2.35 per cwt. Four cents were paid for each point above. Bran sold for $25 per ton; mixed hay, $16; corn, $25; alfalfa, $30; straw, $8; silage, $6; oil meal, $38; oats, $34.

WORTHINGTON

KEROSENE ENGINES

FROM
1½ TO 25 H.P.
STATIONARY
AND
PORTABLE

THE ENGINE OF TODAY

THE conservative buyer selects the WORTHINGTON Engine because it just exactly fills the bill and the price is absolutely right. Dollar for dollar you get the most satisfaction and the greatest value for your money.

WORTHINGTON Engines are substantially constructed. They have the Power! They operate on the cheapest fuels! Are easily started in the most severe weather! The speed is uniform and they are entirely dependable!

If you do not now own one of these engines, it will be to your advantage to write us for full information and name of nearest dealer. Large catalog free upon request. Use the Coupon.

Hope Guernseys Average $479

In the J. L. Hope Guernsey sale May 12, fifty-six animals brought an average of $479. A three-year-old daughter of Ne Plus Ultra, Florham Marigold, went for the top price of $4,100 to Florham Farms, New Jersey. Geo. W. St. Amant of Massachusetts paid the second price, $2,000, for Princess May of Linda Vista, by Beda's May King, and with a Class BB record of 12,232.7 lbs. milk, 627.48 lbs. fat. Mr. St. Amant also paid $1,450 for Follyland Joyous by Dimple Masher of Glenburnie and out of a daughter of Langwater Peerless. Imp. Bon Espoir XVII, by Imp. Clara's Sequel, went to Harbor Hill Farm, N. Y., for $1,600. Only one other animal reached the $1,000 mark—a bull calf, Florham Marquis, a grandson of Ne Plus Ultra and out of May Rose Maid, went to John Lloyd, Jr., of Pennsylvania.

Other animals selling for $500 or more are as follows with their purchasers:

Childs Frick, New York	
My Princess	$550
Imp. Sales Girl	750
Fannie IV of Lilydale	550
John Lloyd, Jr., Pennsylvania	
Gloria of Linda Vista	$625
S. M. Shoemaker, Maryland	
Ultra Select Rose	$625
Geo. C. Russell, Ohio	
Primrose of Linda Vista	$750
F. E. Hasler, New Jersey	
Florham Superior	$600
H. Swinglehurst, New Jersey	
Florham Rosa	$500
L. F. Loree, New Jersey	
Golden Cross Edna of Linda Vista	$525

EDITORIAL COMMENT

No family of five should buy meat until they have bought at least three quarts of milk.—PROFESSOR GRAHAM LUSK.

A FILLED MILK BILL

Congressman Edward Voigt has introduced a bill in the House of Representatives to amend the Pure Food and Drugs Act so as to make it unlawful to ship in Interstate Commerce any form of milk or cream which contains any fats or oils other than milk fats.

Mr. Voigt says that the object of this bill is to destroy the trade in certain brands of condensed and canned imitations and substitutes for milk which have been placed on the market in large quantities in recent years. These substitutes are made from skimmed milk and cocoanut or other vegetable oil or fat. These substitutes are offered in family size and also large cans and the unsuspecting public is served with the substitute in place of milk in hotels, restaurants, and boarding houses. It is also used in the manufacture of ice cream. The substitute looks like milk, tastes like milk, but is not milk. It is sold very largely to the poorer and foreign element of the population. They think they are buying milk. As a food for children, the substitute may be worse than worthless as it does not contain the elements for the promotion of growth in children and infants found in real milk. According to the United States Market Report the output of this substitute has increased over five thousand per cent between 1916 and 1919. It is estimated that in 1920 almost two and one-half million cases of this substitute were manufactured. Mr. Voigt says that the manufacture and sale of this substitute is not only a deception on the innocent consumer, but it is also a detriment to the dairying interests of the country.

LET US BE THANKFUL

It is well for us to lift our eyes from our own work and conditions and look about that we may see how others are being served. If we confine our vision too largely to our own conditions and brood too much over our own troubles and tribulations, we may get to thinking that our lot is the hardest.

Although we are passing through a period of readjustment when things are out of alignment, we must remember there is nothing fundamentally wrong with our country. It is only a matter of time before we shall again return to normal business conditions and prices of other commodities will be in keeping with prices of farm products. It is not well to take this period too seriously. We must accept it as a part of the results of the war and proceed to do our work courageously and with good cheer. The conditions on the farms in this country are so much better and we have so many more things to be thankful for that when we compare our conditions with war-worn Europe, we may well stop and ask ourselves, "Why do we complain of our own situation?"

Captain Charles Boettger, in command of the Polish-American liner "Gdansk", which plies between this country and Poland, said, as his ship slipped from her moorings at the Brooklyn Army Docks carrying the corn meal from 37,500 bushels of corn which is part of the gift of the American farmer to the hungry people of Europe:

"You farmers will never know what your help means to my people and the other people of war-worn Europe. You have never faced conditions such as they face now. I have seen families so poor they have had to clothe themselves in odd pieces of salvaged burlap. Food—they have none, save for the donations of you Americans and others more fortunate, doled out sparingly so that all may have a little something to quiet the gnawing pains of hunger."

This is not a condition which we like to feel exists in the world, but it is well to reflect upon the situation of these people in order that we may take the proper view of our own affairs. The farmers of this country not only have an adequate supply of food and clothing and good homes to live in, but means to own fifty per cent of the automobiles in this country. They are entitled to this luxury, for no class of people works more industriously or contributes more wealth to our nation than the farmers.

We must not permit ourselves, when other parts of the world are suffering for the want of food and clothing, to brood over our conditions when we are permitted to enjoy the pleasure of good homes, opportunity for service, plenty to eat and wear, and luxuries for recreation.

FILLED MILK COMPETITION

A group of farmers at Watertown, Wisconsin, has just received a convincing lesson of the meaning of the competition filled milk offers the dairy farmer, how it makes a market for the cocoanut cow and destroys a market for butterfat. They had heard that last year the makers of filled milk put on the market the equivalent of eight million pounds of butter to compete with the regular and usual supply, but their local problem drove the lesson home.

These farmers desired to get together to market their milk as cream in place of selling to a local condensery. A committee was sent to Milwaukee to interview ice cream manufacturers, expecting to find a ready sale. What they found put these men solidly in support of legislation forbidding the manufacture and sale of filled milk. They found these ice cream manufacturers were getting their supply of fresh cream from a condensery that was skimming the whole milk received from its patrons, selling the cream, and adding cocoanut oil to the skimmilk to make filled milk.

These Watertown farmers could not market their cream in the manner they tried because the cocoanut cow got in ahead of them. To make it even more effective, the factory making the product was located only fourteen miles distant from their own station.

There is much more to this filled milk proposition than competition; there is fraud and deception on the consumer. If more farmers, though, could have the close-up view these Watertown farmers had, their state legislature would be beseiged with requests to support the anti-filled milk bill and Congress would be somewhat more inclined to find reason for passing such legislation as proposed by Congressman Voigt.

BUREAU OF MARKETS

The Grain Dealers' National Association has come to the conclusion that the Bureau of Markets should be abolished because this department of government, they hold, has become an enemy of the independent grain dealer. They claim it is counselling the county agents in the various states to function as distributing agents. They also hold that scheming politicians are using the county agent as an entering wedge to get their hands in the treasury of the United States and that these county agents are displacing the commercial middleman with a political middleman. In fact, they declare it is socialism.

The Grain Dealers' National Association is confused in its reasoning. The county agent has nothing to do with the Bureau of Markets, and the Bureau of Markets has no jurisdiction over the county agent. The county agent is supported and directed by an entirely different department of the government. Along with his other manifold duties he assists farmers in forming co-operative marketing companies. He is an agent of the farmers and assists in doing the work the farmers desire to have done. He is supported, as announced by the Grain Dealers' National Association, by general taxation, but his work is to serve the farmers. It is reasoned that if he serves the farmers well he will be able not only to increase production but also facilitate the marketing of farm products. It seems to us that neither of these two groups is taking the right attitude toward the county agent.

We must increase the production of our acres and our herds and our flocks. This is the largest and the best way for the farmer to increase his profits. If there is an over-production, and no market can be found for all that the farmer raises, the best system is to reduce the number of animals kept, but the acres used and the animals kept should be required to give the largest returns in keeping with economic conditions.

The Bureau of Markets is performing a useful function in giving information concerning marketing conditions in the various trading centers of the United States. This service is extended to all, even the grain dealers. The county agent is extending a useful service to the farmers in assisting them to organize co-operative manufacturing and marketing associations. As long as these two agencies are serving their constituencies well, they are bound to continue in service. Co-operation is not socialism. Neither is the government in business because it gives its people useful information pertaining to markets and assists in forming co-operative enterprises for the more economical handling of farm products.

WHY SCRUB BULLS

Can anyone explain why there are more scrub bulls than pure-breds at the head of dairy herds? We are satisfied that "price" is not keeping dairy farmers from buying pure-bred bulls, for well bred bulls can be purchased at nominal sums. What is it, then, that keeps a great army of men from using animals that have been bred for centuries for a specific purpose? We believe it is a lack of understanding of the value of improved blood upon the part of men who keep scrub bulls. In many instances they do not have the desire for improving their conditions. No person ever made progress or improved his condition without effort and well laid plans. This requires thought and study which these men do not care to give.

Recently a number of well bred bulls sold for an average of a little less than a hundred dollars apiece and in a county where only 15 per cent of the bulls are pure-bred. One bull of exceptional type and out of a dam that had a good record sold for $45. The dairy farmers in that county are not awake to their opportunities nor do they appreciate that the present prices of bulls are rare bargains.

The man who owns a scrub should get rid of him and buy a real bull. There can be no pride of ownership in owning a scrub; no stimulating desire for improvement; and no enjoyment in looking forward to the development of his progeny. The scrub has a depressing influence for he offers no hope for improvement and little reward for the effort in caring for his get. The dairy farmer who desires to do better, who wishes to improve his herd, never had a better chance to purchase a pure-bred bull, at moderate prices, than at the present time.

Prices for Farm Labor

Will you please tell me the general wage paid dairy help, with board and room, and where house is furnished and man boards himself?

Raton, N. Mex. W. J. C.

Labor prices vary considerably from section to section and even from farm to farm. Much depends upon the local demand and within the locality, upon the efficiency of the labor hired, and the demand of the farmer for a higher or lower grade of labor. The average price for dairy farm labor will probably run from $40 to $50 per month at the present time. There are farmers who are paying as low as $30 and some who will be paying $60 to $70 or more per month.

In a survey made by the Wisconsin College of Agriculture in 1918, they found that where men

were hired for a full twelve months in the year, the wages in 8 different sections of the state ranged from $38 a month to $47 a month, the weighted average being $41.50 per month. Where men were hired merely for the cropping season, the wages ranged from $42 to $52, the average wage being $46.

As a general rule, married help will receive a somewhat higher monthly wage than single help but this is more a question of efficiency than of marital state. The rate of wages will also be gov erned somewhat by the extra supplies given to the married man. In many localities, it is the custom to supply the married laborer not only with his house and garden but also with a sufficient amount of milk for his family, with feed for his own poultry or with eggs from the farm flock, with a share of the animals butchered on the farm or possibly with one or two dressed hogs during the year, and with fuel. The man is also allowed sufficient land to grow such potatoes as he desires and has the use of a horse to cultivate the same, as well as for driving to town and other such purposes. In most cases, it is expected that the man will do the work on his own ground after hours.

Making Sweet Clover Hay

Sweet clover growers generally prefer the fall crop of the first year for hay, since the growth then is finer and the hay is of better quality than at any other time. The cutting from this crop is practically equivalent to first class alfalfa hay. On soil that is limed and inoculated, approximately a ton of hay per acre can be cut in September or early in October. A full crop of grain, together with an additional ton of hay when sweet clover is seeded with the grain, makes a very satisfactory return.

In the spring of the second year, the growth of sweet clover is more rank and somewhat coarser. It is more than likely that this crop is in most large use for hay but it is difficult to cure in many seasons because it should be harvested earlier than the usual hay crop and it is also inclined to be very heavy and succulent.

The proper time to cut the first crop the second season will vary considerably in different localities, depending much upon the rainfall, the temperature, and the fertility of the soil. In no event should the plants be permitted to show flower buds or become woody. In the drier sections, the best results usually are obtained by cutting the first crop when the plants have made a growth of 24 to 30 inches. On fertile, well limed soils, the plants often will not show flower buds until they are about 5 feet high. On such soils, it is very essential that the first crop be cut when the plants have made no more growth than 30 to 32 inches, if hay is desired which is not stemmy and if a second crop is to be expected.

It is not necessary to leave more than an ordinary stubble when cutting the sweet clover crop in the fall of the year of seeding. A stubble of four or five inches, however, will serve to hold drifting snow and will be of some help in protecting the plants from winter injury.

While the first crop in the second year comes from the crown buds, the new branches which produce the second crop of the second year come from the buds formed in the axils of the leaves on the lower portions of the stalk which constitute the first crop. These branches usually commence growth when the plants are about 24 inches high. In fields where the stand is heavy and where the lower portions of the plants are densely shaded, these shoots are soon killed from lack of necessary light. It is therefore very important when cutting this crop to cut the plants high enough from the ground to leave on the stubble sufficient number of buds and new branches to produce a second crop. In fact, the stand should be cut several inches above the young shoots or buds, as the stubble may die back from one to three inches if the plants are cut during damp or rainy weather.

When fields of sweet clover contain only a medium heavy stand and when the plants have made no more than a 30-inch growth, a five- to six-inch stubble usually will be sufficient to insure a second crop. When the fields contain heavy stands, it may be necessary to leave an eight-inch stubble. In semi-arid regions, where the plants do not make as rapid growth as in humid sections, they may often be cropped somewhat closer without injury.

If desirable, a second crop of hay can be cut in the early fall of the second year. When this is done, the crop which would otherwise mature seed, is cut while in the blossom. The grain binder is generally used in cutting this crop and the hay is shocked in such a way as to permit thorough curing. This hay is rather coarse for cattle, but is excellent feed for horses.

In the drier sections of the country or when the first crop of the year is cut for hay in the North Central states, the mower may be started in the morning as soon as the dew is off. The hay should remain in the swath until the following day, or until it is well wilted, when it should be raked into windrows. After remaining in the windrow for a day, it may be placed in small cocks to cure. Cocks made from hay that has dried to this stage will not shed water well and it is preferable to cover them with hay caps. It is considered important to make the cocks small enough to be thrown on the rack entire, as many leaves will be lost if it is necessary to tear them apart.

When sweet clover is permitted to dry in the swath, a large percentage of the leaves will be lost in windrowing and loading unless handled with the utmost care. Hay in this condition should never be raked while perfectly dry and brittle, but should be raked into the windrow in the early morning or in the evening when it is slightly damp from dew. It may then be hauled to the barn or stack after remaining in the windrow for a day.

One of the most successful methods for handling sweet clover hay, especially in regions where rains are likely to occur at haying time, is to permit it to lie in the swath until the plants are well wilted or just before the leaves begin to curl. The hay should then be raked into windrows and cocked at once. The cocks should be made as high and narrow as possible, as this will permit better ventilation. In curing, the cocks will shrink from one-third to one-half their original size. It may take 10 days to 2 weeks to cure sweet clover by this method, but when well cured, all the leaves will be intact and the hay will have an excellent color and aroma. When sweet clover is cocked at this time the leaves will cure flat and in such manner that the cocks will readily shed water during heavy rains.—Abstracted from Farmers' Bulletins 820 and 1005.

Cowpeas for Hay

Kindly advise me how many cowpeas to sow per acre on a light clay ridge soil for hay? What are best kind to sow? How much inoculation does it take per 100 lbs. and where can it be bought and at what price?

Festus, Mo. E. J.

For all around use in Missouri, the whip-poor-will cowpea is, perhaps, one of the best varieties. It is medium maturing and makes a good hay. When used for hay, cowpeas are best when drilled with a grain drill, using the oat cups and sowing from 4 to 5 pecks per acre. It frequently pays to sow more than this, some men putting in as much as two bushels. This makes a finer hay, but if the season is favorable a smaller seeding of three or four pecks is usually ample. It has been recommended, under very favorable conditions, every other cup of the grain drill may be stopped and the drill set to sow five pecks per acre, thus actually seeding at the rate of about two and one-half pecks.

The inoculating material may be secured from nearly all seed houses or possibly it may be secured from the College of Agriculture at Columbia. Prices for this culture vary, it usually amounts to about $1.00 for a sufficient quantity to treat one bushel.

Breeding Fees

I am taking on a few of my neighbor's cows to breed to my registered Holstein bull and would like to know what the custom is regarding payment for such service. It would seem to me that a contract should be signed by the owner of the cow, stating the time payment is due and the terms.

Geneseo, N. Y. L. E. D.

There is no formal written contract that is generally used where bull service is given to an outside herd. As a general rule, it is expected that the service fee will be paid when the cow is known to be safe in calf. This can easily be ascertained by the usual methods. In many instances, however, the service fee is not actually paid until the calf is born, the fee varying sometimes according to the sex of the calf. In the case of valuable pure-breds, however, the previous rule generally applies.

The rate of payment for service varies considerably, according to the quality of the animals mated and such special conditions as may prevail. Where it is purely a matter of accommodation between neighbors, the price is usually very moderate, ranging from, perhaps, $5 to $20, although in the case of extremely valuable animals, the fee may be in terms of hundreds of dollars.

Vetch for Green Manure

I have a field of clover sod to plow in the early fall to be planted to corn next spring. Would like to seed it to winter vetch this fall and turn it under next spring. What kind of seed would you recommend? Should it be seeded alone or mixed with winter rye?

Westby, Wis. C. S.

Where vetch is sown in the fall for a green manure crop to be turned under next spring, the variety used is winter vetch, or hairy vetch, as it is usually called.

Since vetch is a viney plant and without support grows close to the ground, it is a good plan to grow it with rye, seeding the two at the same time. To the regular rate of seeding rye, add from 25 to 40 lbs. of winter vetch. The crop should be plowed under next spring at least a week or ten days before corn planting time.

If the field is carrying a heavy clover sod this year and the soil is a good medium sand or clay loam it might not be necessary to follow the practice referred to above. However, if the soil is lacking in a humus content, the practice of green manuring with rye and vetch might very well be considered.

Silo Pits

I see you have a subscriber that wants to know about digging a pit for a silo. Last year I dug a pit 6 feet deep and put a wooden silo on top. The ensilage in that pit was perfect. The only damaged ensilage was where the wooden silo fit on the foundation and was due to leakage of air. One can throw the ensilage out of a six-foot pit easily; in fact, I do not see but one objection to putting all the silo under ground; that is, to find a way to elevate ensilage.

Terre Haute, Ind. J. H. S.

It is possible the trouble where the pit and the silo join can be overcome by plastering wood fiber around the bottom of the staves so as to make a more gradual slant into the concrete pit. If the cement shoulder extends into the silo more than an inch, it will probably be necessary to use stone and cement to make a plaster shoulder on which to apply the wood fiber plaster. If this is not done, the fiber plaster probably will not hold in place when put on too thick. The fiber plaster is also efficient for filling decayed spots in wood staves.

Butterfat Prices

What price was paid for butterfat for the months of November and December, 1920, and January, February, March, and April, 1921, at your local creamery?

Wadsworth, Ill. A. E. J.

The local creamery at Fort Atkinson paid the following prices for butterfat during the past six months: November, 66c; December, 57c; January, February, and March, 51c; and April, 46c. A cooperative creamery some four miles in the country paid the following prices: November, 60.5c; December, 49.8c; January, 52c; February, 53c, and March 51.3c.

In both cases cited above, the prices are net, meaning that it is the price the farmer receives at his door per pound for the butterfat in his cream, all charges for hauling, making, etc., being deducted before these prices are set.

Twin Calves

My best Jersey cow has recently given birth to twin calves—a bull and a heifer. Some say the heifer under these conditions will not breed, and a neighbor, who is a subscriber to your paper, also says you had an article on this subject stating the same facts.

Amelia C. H., Va. L. L. W.

It is very unusual that a heifer twinned with a bull will breed. Twins, where both are female, will breed and twin bulls will breed; also a male twinned with a heifer calf will breed. It is so unusual that a heifer twinned with a bull will breed that we consider it unwise to raise such an animal for the small chance that she will reproduce.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

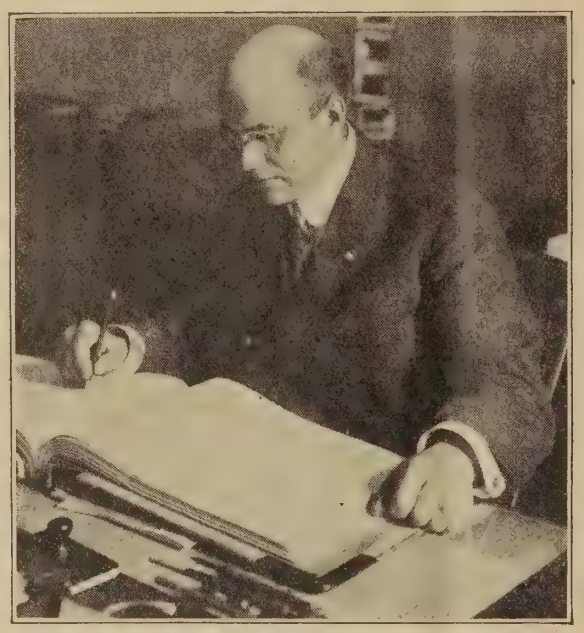
Coming Events

June 1.—American Jersey Cattle Club, annual meeting, New York City.

June 1—Holstein-Friesian Association of America, annual meeting, Syracuse, New York.

June 9—Ayrshire Breeders' Association meets in Springfield, Mass. Secretary, J. G. Watson, Brandon, Vt.

June 22-25.—Tuberculosis Eradication Conference, State House, Boston.



Cheese Moisture

The Wisconsin legislature has just passed a law which establishes a new standard for cheese manufactured in that state. The old standard required not to exceed 40% moisture, while the new standard provides that American cheese shall not contain more than 38 per cent moisture.

Rabild Leaves Dairy Division

Helmer Rabild, who has rendered a splendid service to the dairy industry during the thirteen years he has been a member of the Dairy Division, has tendered his resignation to become manager of the surplus plant of the Michigan Milk Producers' Association.

Mr. Rabild was born in Denmark and devoted his early years to dairy farming and the operation of creameries in that country. He graduated from a Danish agricultural college and took courses in dairying at the Michigan College of Agriculture, after he came to this country in 1900. He worked in Michigan, first as a helper and later as a buttermaker and manager. In 1905, when a new dairy law was passed in Michigan, he became the first dairy and food inspector. His special work was that of "trouble man" or "efficiency man" in connection with the difficulties in the operation and management of creameries. Through his suggestion to the commissioner, the first cow testing association in the United States was formed at Newaygo.

HELMER RABILD AT WORK ON THE RECORDS OF A COW TESTING ASSOCIATION WHICH ORGANIZATION HE HAS ABLY FOSTERED SINCE ITS INCEPTION IN THIS COUNTRY

Mr. Rabild became a member of the Dairy Division in 1908 and was placed in charge of cow testing association work. Then he took up the organization of bull associations. At the present time there are about 500 cow testing associations and 140 bull associations in the United States. In addition to this work he has had charge of other dairy extension projects under the department which include dairy production and manufacturing work in the South and West.

Mr. Rabild comes to his new position with large and successful experience, and we have no doubt but that his management of the new undertaking of the Michigan Milk Producers' Association will bring them success.

Wisconsin Holstein Breeders Meet

The annual meeting of the Wisconsin Holstein-Friesian Breeders' Association held at Milwaukee May 16, brought out a good attendance. The morning session was devoted entirely to the president's address and the report of Secretary Oldham.

At the opening of the afternoon meeting Professor L. J. Cole of the University of Wisconsin gave an interesting lecture on the occurrence of red and white calves from registered Holstein parentage, showing how they must occasionally be expected because of some of the early red and white Holsteins in Holland.

He was followed by John M. Kelly of New York, who very forcibly brought out the great lack of the present dairymen and cattle breed associations. The breeders and dairymen, producers of a fifth of the food products of the country, are themselves organized but they have provided no means of reaching that other very necessary member of the combination—the consumer.

With a business that employs approximately 5,000,000 people, that produces annually a product worth upwards of $2,500,000,000, and with from 20 per cent to 25 per cent of the children of the country actually suffering from a lack of dairy products, it seems strange that more effort is not directed toward the consumer, particularly when that lack of effort loses the dairymen of this country millions of dollars annually.

The people of this country will buy if you show them why they should—their consumption of luxuries proves it. Mr. Kelly urged intelligent advertising as the only real solution of the matter. He particularly urged Holstein men to back some form of Holstein milk advertising campaign.

At the business meeting following the program the following officers and directors were elected: Robert A. Ryan, president; Herbert Schroeder, vice-president; W. C. Leitsch, treasurer; B. M. Aaries, Charles Hampke, and S. H. Bird, directors.

Several changes in the by-laws of the association were made, the most important having to do with the election of officers and directors which have heretofore been elected by the open meeting.

Both the secretary and the treasurer are to be elected by the board of directors. Three of the directors are to be appointed by the president, and the other six are to be elected by county delegates at the annual meeting.

Each county shall be entitled to at least one delegate and those having more than fifty members to the state association shall be entitled to one for each 50 members or major fractional part, the delegates to be elected by members in their respective counties.

All other association business is to be settled by the members present at the meeting as heretofore.

This will, it is hoped, increase interest in the state association in many counties that cannot always be well represented at association meetings.

New York Pooling News

HOARD'S DAIRYMAN:—So far as I know, every milk dealer in League territory took up the cudgel to defeat pooling when the plan was proposed last fall, and nearly everyone continued attack until about the last. It was some surprise to me, then, to hear the president of one of the important concerns recently discuss the pooling plan and give it sanction as the best thing for all parties. He considered it something for the dealer to advise, although he fought it with the others and contributed to the conference board to continue the fight to the day when it went into effect.

This milk man advised that all the dealers will now deal with the League and pay to the poolers' orders the stipulated price in the class of milk that they buy. They will pay no more to non-poolers than the price the League pays the poolers. That is the bargain they say, and they will live up to it. At the same time I have my suspicions that there will be difficulties and differences. Dealers will buy on prices at $2.30, $2.10, or $1.80 or they will pay on the market price for butter and cheese. This last is the fourth class.

To my surprise the dealer said that he understood that Nestle's will accept the situation and buy promptly through the League. I could hardly understand this and questioned further. He qualified that he so understood but was not present personally at the meeting. I stopped at a Nestle's plant yesterday to see what is going on. It is a small business and when I called it had closed for the day. On the bulletin board I found a notice which read in effect something as follows: "For May we will pay $1.90 for 4 per cent milk and will pay direct to those who supply milk the full month a bonus of fifty cents a hundred." There was also the usual variation for test of four cents a point.

To my mind this is not at all like League business. It comes down to three per cent milk at $2 a hundred and I assume that two dollars is probably what they expect will be the League price for pooled milk or as near to it as they can estimate. Notice that they say "direct", which I take to mean not paid to poolers. Whether they expect to buy of those who have signed the pooling contract and further that they expect to pay through the League I do not know. Their price of $1.90 for 4 per cent brings 3 per cent milk down to $1.50. There is no such price in the League so far as I know.

We are pretty certain now that the League sells milk with the understanding that the buyer taking milk from non-poolers will pay them only such prices as are paid to regular supporters of the League. It is also stated that in case of a surplus only such milk as is in the pool will be sold at full prices. I cannot yet see how this is to work, but it is evident that there is no disposition to allow those who refrain from support of the organization to get the best of the others. At the same time we hear those who have refused to sign say that they will get the full $2.30 for market milk while regulars will get only the pooling price. Such statements from slackers do not make for friends and they undoubtedly are not true. They only reveal the character of the men who make the statements.

It is freely asserted that had it not been for the pool we might now get only $1.75 or perhaps less for milk for May, while we may reasonably expect perhaps the $2 offered by the Nestle's. Unfortunately there goes with this the prediction that dairying will now prosper and we will get cost of production and a profit all the time. Some of us, it seems to me, are too optimistic on this score. At the same moment the price of cattle goes up somewhat. It shows what is in the minds of many people. I fear that the only men who will get this cost of production and a profit will be the men who can reduce the cost of production below the average. Some are fortunate in this regard. Human nature is so constituted that the moment there is a prospect to make even or a little better we expand the business and bring an overproduction.

New York. H. H. LYON.

"Eat a dish of ice cream every day," read the ads of one big company. It's good advice, and you can make the cream yourself.

Fifty-Six Guernseys Average $1,087

Eastern Guernsey Breeders' Association in Highly Successful Auction Finds Friday, the Thirteenth, a "Lucky" Day

THERE was no "bad luck" in the date—Friday, May thirteenth—for the Eastern Guernsey Breeders' Association. Even number thirteen in the sale, led in the auction ring at thirteen minutes past the hour went for a price ruinous to all superstition. Fifty-six head consigned by twenty breeders brought an average of $1,087, the top price being $4,000 and only six animals selling for more than $2,500.

When the association appointed its sale committee, E. T. Gill, I. W. Roberts, Lowell Gable, M. M. Hollingsworth, M. T. Phillips, and G. W. Koser, it assured itself of a consignment auction of the highest merit. Of the fifty-six animals sold everyone was a good one. Not a single individual entered the ring which was not worthy of use as foundation stock. The appointments of the sale were excellent; the crowd one of the largest ever gathered at a Guernsey auction; and the sale, as a whole, one of the best cattle vendues ever held.

The high value of the day, $4,000, was paid G. W. Koser of Pennsylvania for Westbrook Ultra Rose, fourth cow in GG with a record of 13,131.7 lbs. milk, 621.99 lbs. fat, and by a grandson of Ne Plus Ultra and Imp. May Rose King. The dam, a granddaughter of Imp. King of the May, May Rose of Westbrook Farm, leading cow in BB with 15,530 lbs. milk, 757.07 lbs. fat, was sold by the same consignor for $2,500. Both daughter and dam went to Florham Farms, New Jersey.

Ultra Foam, consigned by S. M. Shoemaker, and Brookmead's Queen, consigned by Frank Graham Thomson, brought $3,500 each, R. L. Benson taking the former and Mrs. J. M. Mattice the latter, both buyers from New Jersey. Ultra Foam was the only Ne Plus Ultra daughter sold. Brookmead's Queen is by Langwater Stars and Stripes.

Only two bulls sold. Pencoyd Perfection, from the herd of T. W. and I. W. Roberts, went to Hynicka Bros. for $3,050. This strongly bred May Rose bull is a grandson of Beda's May King and out of Langwater Early Rose, one of the greatest daughters of Imp. King of the May. A double grandson of Langwater Stars and Stripes, Brookmead's Search Light, from the Thomson herd, went to Circle W Farm, Ohio, for $2,000.

The four animals consigned by T. W. and I. W. Roberts averaged $2,500, five consigned by Frank Graham Thomson averaged $2,255.

An interesting feature of the sale was a guessing contest in which those in attendance estimated the average price of the auction. A Guernsey heifer calf valued at $500 was offered to the one whose estimate was nearest the actual price. Guesses ranged from $268 to $3,500, the great percentage being within $200 of the average received, $1,087.67. The estimate of H. W. Wheeler, Pennsylvania, of $1,090 tied with that of a young Maryland breeder in being closest. The flip of a coin gave the calf to Mr. Wheeler.

Listed below are the names and purchasers of all animals selling for $500 or more excepting those mentioned above:

R. R. M. Carpenter, Delaware
- Bonita Fillmore $775
- Clare of Gerar 3rd 775

Geo. W. St. Amant, Massachusetts
- Langwater Empress $3,000
- King Charlotte of Brookdale 525

Willow Creek Farm, Pennsylvania
- Westbrook Itchen Rose $925

Edwin Balderston, Maryland
- Elizabeth's Maid of Haddon 2nd $500

Daniel Buckley, Pennsylvania
- Wasteland Decorous $750
- Wasteland Dimple 750

I. A. Boucher, New York
- Della of Wasteland $500
- Breidablick Primrose 800

H. W. Leeds, New Jersey
- Pauline's May Girl $875
- Janet Hedges 825

Harbor Hill Farm, New York
- Gerar Kitty $960

Geo. C. Russell, Ohio
- Prue's Jehanna $500
- Breidablik Daylight 925

S. C. Emmons
- Sequel's Milkyway of Wawa $525

E. A. Rile, Pennsylvania
- King's Rose of Clover Plain $650
- Melinda S's Hilda 600

C. L. A. Whitney, New York
- Glen Gable Emblem $1,000

Brooklandwood Farm
- Raider's Deruchette $725

Lowell Gable, Pennsylvania
- Clover of Pencoyd 3rd $2,100

G. M. Hendee, Connecticut
- Early Rose of Pencoyd $2,300

Mrs. B. M. Coursen
- Frank's Quail of Fritzlin $550

H. A. Frankenfield, Pennsylvania
- Main Stay's Daisy of Wawa 1,050

Mrs. J. M. Mattice, New Jersey
- Jingle Girl of Haddon 625

Geo. Wood, Pennsylvania
- Brookmead's Daffodil $2,000
- Royal's Alphea 925
- Rose of Pencoyd 4th 2,525

Circle W. Farm, Ohio
- Imp. Unity of Passee Villa $550

Brookmead Farm, Pennsylvania
- Royal Master's Daylo Maid $875

Chilmark Farm, New York
- Westbrook Ultra Maid $600
- Westbrook Enchantress 600
- Xmas Dolly 1,700
- Charter's Noble Fannie $525

H. B. Shenk, Pennsylvania
- Glen Gable Galore 2d $525

J. T. Hastings, Pennsylvania
- Imp. Marinette of Mara Alva $575

G. W. Koser, Pennsylvania
- May King's Benton Omega $825
- Imp. Cyrene of Mara Alva 775
- Woodside Hope 800

J. S. Herkness
- Furnessia 2d $575

Beaver Ridge Farm, New York
- Double May Rose of Walter Maple $500

L. S. White, New York
- Juno of Barrington $625

H. W. WHEELER AND THE GUERNSEY CALF HE WON IN THE GUESSING CONTEST

WESTBROOK ULTRA ROSE TOPPED THE SALE AT $4000
Her dam, May Rose of Westbrook Farm, brought $2500. Both were consigned by G. W. Koser and both purchased by Florham Farms.

THE MEN BEHIND THE SALE:—G. W. KOSER, PENNSYLVANIA; L. MERRYMAN, MARYLAND; E. T. GILL, NEW JERSEY; AND FRANK GRAHAM THOMSON, LOWELL GABLE, I. W. ROBERTS, AND M. T. PHILLIPS, ALL OF PENNSYLVANIA

G. W. Witter Dead

G. W. Witter, one of the pioneer Holstein-Friesian breeders of Marathon County, Wisconsin, is dead. Mr. Witter has been a breeder of black and whites for more than forty years. He sold over two hundred head of pure-bred Holsteins and at the time of his death owned forty pure-breds.

New York Guernseymen Vote Field Secretary

At its annual meeting in New York City, May 11, the New York Guernsey Breeders' Association voted to strengthen its organization and to employ a field secretary. Karl B. Musser, extension man for the American Guernsey Cattle Club, reviewed the work in Ohio where the first Guernsey state fieldman is now employed, and pledged his assistance to New York breeders in a similar undertaking.

It was decided to hold a combination sale of New York Guernseys again this year and the invitation of Chilmark Farm to the sale management to locate the auction on its grounds was accepted. Geo. White was given charge of the sale.

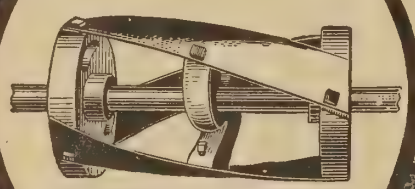
Professor E. S. Savage of Cornell asked for the support of the association in improving the show of Guernseys at the New York State Fair. He stated that only tuberculin tested animals will be accepted for entry and that accredited herds can be kept separate from all other cattle. The $50 fund for prizes in county classes which Professor Savage asked was voted.

The main feature of the program was the presentation of cups to owners of the highest producing New York Guernseys for the past year. Colored slides were used in bringing the animals before the breeders present and interesting statements were made by owners or care-takers concerning the pedigrees and methods of feeding and management. The cup-winners and their owners follow: La Charmonte Princess, G. W. Warrell; Imp. Blanchflower XX, Henry Sage; Dora of Allen Farms, J. O. Winston; Mabel of Tarbell Farm, H. H. Buckley; Ultra May Queen, Jules Breuchard; Princess Ultra Grace, W. H. Gratwick; Winona of Beaver Ridge, J. O. Winston; Bessie of Portland, Henry W. Howe; Ultra Celia, grand champion in the single letter classes, Jules Breuchard; Masherlette of Harbor Hill 2d, grand champion in the double letter classes, Robert S. Stuart; and Enola's Edith, N. L. Whitacre. The bull winning the cup offered for the sire whose two or more daughters make records exceeding requirements by the largest percentage was Ultra May King owned by J. O. Winston.

The officers serving the association during the past year were re-elected: C. L. A. Whitney, president; C. H. Heckler, secretary-treasurer; F. G. Benham and G. E. Tarbell, executive committee members; and W. B. Jones, James H. Seaman, L. A. Toan, H. H. Buckley, and R. H. Alexander, vice-presidents.

SAFETY

Cuts Like a Lawn Mower—Just as Safe

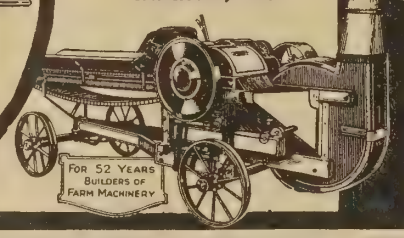


The cutting cylinder on the Rowell has three, or four, spiral knives, cuts like a lawn mower—and is just as safe to use. Cuts all the ensilage just as you want it—cutting edges quickly adjusted. Gives clean-cut, quality ensilage that packs right and prevents spoilage caused by air pockets

ROWELL
SAFETY-AUTOMATIC

The Safest Silo Filler—Automatic release on pulley and fly wheel allows cutting cylinder to stop *instantly* if foreign substances, such as iron or stone get into the machine. Reverse lever operates under any load at any speed—no danger of stripping gears.

Light draft, large capacity, low upkeep, automatic feed, rigid construction. All moving parts guarded.



SAFETY CYLINDER CUTTER

Cylinder type—the safest machine. Knives cut three lengths of ensilage. Knife grinder attachment makes it easy to keep knives sharp. Send for our catalog.

Own your own Rowell and be ready when the corn calls. Send us the size and height of your silo and the power you have, and we'll quote you on the Rowell you need. *Booklet free.*

New York Dairy News

HOARD'S DAIRYMAN:—Commissioner of Agriculture George E. Hogue announces that this year's New York State Fair will show the world it can out-manufacture them all when it comes to cheese. Mr. Hogue is an old time cheese expert. His last year's demonstration that an excellent 6-ton cheese can be made and sold was a striking success. The cheese was so big it could not go by freight from Lowville where it was made by Mr. Loomis, a veteran cheese maker. A special motor truck carried it to the fair where a section of the front of the dairy building was removed in order to admit the huge cheese. This year a 12-ton cheese is to be attempted. A Chicago concern once attempted an 11-ton cheese, but the product was not fit for commercial use. Mr. Hogue says the 12-ton package can and will be made. Dairy experts will watch to see it exhibited and sold in pound and 2-pound packages at the 81st annual exposition at Syracuse.

The agricultural organizations of Tompkins County are uniting to further a pure-bred sire campaign, and the banks will loan money to farmers who wish such help in replacing scrub sires with pure-breds. It is said no strings are attached to this offer of financial aid in this work. The banks believe that farmers are losing money and wasting time in using nondescript sires.

Dairymen who supply the city of Syracuse with milk are urging citizens to co-operate in reducing losses in milk bottles. They say $200 worth are broken, stolen, or lost each day, costing the dairymen $73,000 per year. This has to be considered when fixing the price of milk. It is to the interests of consumers to help lessen this big loss and so the dairymen are telling them in big type through the city press.

In about three weeks' time the Tompkins' County veterinarian, assisted by a state official, will have tested with tuberculin over 400 animals. About 12% of the animals had to be branded by the big "T" as required by New York State law to show them to be reactors.

The Tompkins County National Bank has come to the front in a way to attract attention of dairymen. This bank is the first in the state to co-operate with the state in paying dairymen's indemnity claims for animals lost through the tuberculin test. The plan is to have regular assignment blanks made out in triplicate furnished by the state and calling for payment of indemnities. The dairyman presents the blank to the bank. On acceptance by the state of the claim, a copy of which is kept by the farmer, the bank, and the state, the bank pays the farmer 75% of his claim. The balance is paid when the state pays the indemnity in full to the bank. This may be many months later, but the farmer can have a large part of his claim honored at once and have it to use.

Recently the New York legislature appropriated $700,000 to pay claims filed prior to March 10 and $150,000 to carry on the work this year. So fast is the test being applied in many New York counties that this fund will not last long and there will be great need of many more banks following the example set by the Tompkins County bank. This, it is said, many banks will do.

There has been much speculating as to working details of the new League milk pooling plan and every crumb of information on the topic is sought by the dairymen eagerly. Local adjustors will be appointed, real dairymen in each milk pooling station, to see to issuing checks, hearing complaints, etc. Local banks will have money deposited in them at the end of each month by the League to pay the farmers for their milk.

This milk will be considered in four classes in fixing prices to the buyers, as follows:

Class one will consist of milk sold in fluid form and milk made into cream and the skimmilk sold in fluid form.

Class two includes milk made into cream and the skimmilk used in any way except sold in fluid form; milk made into plain condensed milk; milk made into ice cream, and into cheese of the soft type.

Class three includes milk made into powdered milk; into sweetened condensed milk; into sterilized evaporated whole milk; or into cheese of the Swiss, Limburger, and similar types

Class four is all that milk made into American cheese or butter.

Prices will of course vary with the class, but returns to producers will be equalized with certain considerations for quality. This will be worked out more in detail as time goes on.

New York. E. G. FEINT.

Feb. 21-22, 1922—Holsteins. Iowa Holstein-Friesian Association's Annual Sale.

Minnesota Holsteins Sell Well

77 Head Average $893

Minnesota's third annual state sale held at Faribault May 4 was in many respects the best sale Minnesota Holstein breeders have ever held. True it did not include a $65,000 bull, a $33,000 bull, or any other $10,000 females. Neither was the average up to those of earlier sales. But it did include a wonderfully good lot of cattle. In fact, right straight through we believe the entries were better than at earlier sales. Further, it is certain that every buyer should have gone home satisfied, and, barring the misfortunes which may come to anyone in the business, he should be even more satisfied with those purchases as time goes on for he bought good animals at prices that made them well worth the money.

Seventy-seven animals were sold for $68,765, just short of a $900 average, a good figure considering present business and financial conditions and no mean figure at any time. Add to that a $65,000 bull and three $10,000 cows as were included in the first sale and you get an average of $2,023, so that even judged from the price standpoint, this sale was practically as good as previous ones.

Bulls were the real sufferers among the entries. Apparently no one wanted a herd bull at any price. Seven good ones were sold for an average price of $483, with $800 the top figure. Axel Hansen bought a bargain at that price in Bess Burke Champion, a yearling son of S. P. O. M. 41st. from a 1086.29-lb. ten-year-old granddaughter of Piebe De Kol Burke. He was consigned by the E. C. Schroeder Farms.

Two females reached the top price, $3,100. Far Oaks Miss Homestead Rue, the first animal in the ring, was struck off at that figure to Brookholm Farms of Minnesota. She is a wonderfully good 3-year-old daughter of Piebe Laura Ollie Homestead King, with a 2-year-old record of 726 lbs. butter from 15,702.4 lbs. milk. She was consigned by the Minnesota Holstein Company.

Beauty Segis Fayne Ormsby was the other top price female. She is a very good individual, a 2-year-old daughter of S. P. O. M. 41st from a 1,057-lb. daughter of Sir Fayne Concordia and in calf to S. P. O. M. 37th. She was consigned by T. H. Skrei and purchased by the E. C. Schroeder Farms.

E. A. Barthelemy of Minnesota, who is just laying the foundation for a high class herd, was the heaviest buyer, taking 13 head for an average price of $882.

Twenty-two animals brought $1,000 or more.

Mack, Krause, and Hanson did the selling, with Secretary B. D. Scott in the box.

Following is a list of those animals selling for $750 or more:

E. A. Barthelemy, Minnesota	
Edenvale Nellie Veeman Pietertje	$750
R. C. Jennie Ormsby Echo Sylvia	2,000
Mankato Ormsby Pietertje	1,600
Bess Johanna Oak	825
Brookings County Maid	1,350
Golden Valley Corabell Ormsby	800
H. E. Bailey, Wisconsin	
Belle Skylark Canary	$1,100
Queen Piebe Hengerveld Ormsby	950
Marie Princess Hartog 3d	800
Maple Grove Thorla Ormsby Mercedes	800
Wm. Wachmen, Minnesota	
Burr Oak Johanna De Kol	$775
J. B. Irwin, Minnesota	
Nina May Pietertje Korndyke	$1,200
J. M. Hackney, Minnesota	
Eureka Lady Segis	$1,100
T. E. Gage, South Dakota	
Mankato Ormsby Bess	$850
Oak Dale Farms, Minnesota	
K. S. P. Segis Lyons	$1,600
Piebe Bess Segis Ormsby	2,500
King Korndyke Pontiac Lass Beets	1,600
Ramsey Co. Home, Minnesota	
Miss Ormsby Hengerveld Colantha	$800
Gus Schmidt, Minnesota	
Rockasene Lady Shabona	$1,250
E. G. Winship, Minnesota	
Miss Netherland Piebe	$1,200
Netherland Korndyke Alladin	1,000
A. G. Haugland, Minnesota	
Queen Hendrika Segis	$800
Carl K. Lunde, Minnesota	
Princess Walker Fayne	$900
C. Graham, Minnesota	
Clara Pietertje Johanna 2d	$1,100
F. E. Lammers, Minnesota	
Gewinna Homestead De Kol Oak	$975
E. C. Schroeder, Minnesota	
Echoland Pava Ormsby	$1,000
Beauty Segis Fayne Ormsby	3,100
E. L. Ferguson, Minnesota	
Pauline Segis Johanna Grahamholm	$1,025

Co-operation won the war! It brought success. Without it we would have lost. Do you tell me that co-operation in peaceful pursuits is not just as desirable and as efficient as in war time? Does only the god of war call out what is strongest and best in us? Does the dove of peace bring unrest and unselfishness and discord? Such things must not be. The American farmer today in his demand for co-operative rights challenges all other peoples to come with him—and through nation wide and world-wide co-operation replace abnormalcy with normalcy.—J. R. HOWARD, American Farm Bureau Federation.

Concrete means safety; safety for your live stock from disease or fire; safety for your dairy produce from contamination; safety for your grain and vegetables from frost and rot. It is the best and cheapest insurance. Build now; build right; build with Lehigh. There's a dealer near you, under the blue and white sign.

DAIRY MARKET NEWS

April Condensery Prices

Manufacturers of evaporated milk report conditions to be greatly improved for that commodity. The reduction of unsold stocks of approximately 44 per cent on April 1 as compared with March 1 and an increase in unfilled orders of 279 per cent confirms this report. Price of evaporated milk during March showed little change, with a range of $4.42 to $6 and an average price of $5.61 per case. Unsweetened evaporated whole milk, in bulk, sold at $9.62 per cwt., while unsweetened evaporated skimmed milk sold for $5.06. The exports of evaporated milk during March, 1921, were approximately 500,000 lbs. less than in March, 1920, when the amount exported amounted to 19,318,000 lbs. Of the shipments during March, 1921, 5¾ millions went to Germany, 3½ millions to Poland and Danzig, and nearly 8½ millions to the United Kingdom.

The market for sweetened condensed milk has been distinctly draggy, both for bulk and case goods. Unsold stocks of case goods in the hands of manufacturers were reduced 41 per cent during the month of March but on April 1 the unfilled orders were practically nil compared with the stocks in the hands of manufacturers. The price of sweetened condensed case goods ranged from $5.25 to $10 per case during April, with an average of $7.97 which was 7c per case less than the average price for February. There has been a very limited demand for sweetened condensed bulk goods and the range in prices has been rather wide. The average price for the month of March for sweetened condensed whole milk, in bulk, was $11.79 per cwt., with sweetened condensed skimmed milk selling at $6.75 per cwt. The downward trend in the price of sugar should help out the manufacturers of sweetened condensed milk. Exports of condensed milk during March were 29,000,000 lbs. or one-third the exports for the same month during 1920.

Raw Milk Prices Generally Higher

The improved conditions in the evaporated milk market were reflected in higher prices paid to producers for milk in some sections. The average price paid for milk by firms manufacturing both bulk and case goods during April was $2.23 or approximately 1c per gallon more than the price paid in March. The average price paid by firms manufacturing bulk goods only was $2.29 per cwt. in April, compared with $2.35 in March.

The prices quoted in Table I are those paid producers for 3.5% milk delivered at factories during April. They are based on reports made by approximately 67% of the total factories in the United States.

The manufacturers' wholesale selling prices given in Table II are based on reports made by manufacturers covering actual sales, during March, of condensed and evaporated milk delivered to jobbers, wholesale grocers, and similar buyers on basis of cash or on short time credit. Foreign prices are given f. o. b. or f. a. s. point of export in which sales were made.

Heavy Receipts Bring Lower Butter Prices

(Report by U. S. Bureau of Markets.)

After maintaining an early show of steadiness lasting over for the most part from the previous week, butter prices again broke sharply starting Wednesday of the week ending May 14. On eastern markets they went to new low levels for the season. The decline was due mostly to an accumulation of centralized cars and undergrades with perhaps some surplus of fine butter toward the close of the week on the New York and Boston markets.

Reports are current that a small amount of Danish butter is enroute for this country at the present time. Offerings have been freely made at 29c C. I. F., and some offerings were even reported as low as 26c C. I. F. New York, or the equivalent of 28½c duty paid. Progress of the pending tariff legislation which would raise the duty from 2½c to 6c is being watched with keen interest.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending May 14, 1921, and the corresponding week a year ago were as follows:

	Week ending May 14 1921	1920
	Cts.	Cts.
New York	33.6	60.9
Chicago	30.9	57.5
Philadelphia	34.5	61.8
Boston	33.8	61.5
San Francisco	31.3	52.9

The receipts of butter at these markets were 13,894,391 lbs. as compared with 7,956,236 lbs. a year ago and 11,208,973 lbs. a week ago.

Declines in Cheese Prices Halted

(Report by Bureau of Markets)

Still lower prices during the week ending May 14 failed to stimulate trading in cheese markets to the extent that dealers had looked for, and for the most part the week's business was quiet enough to be called dull.

The opinion of a majority of distributors seemed to be that there was no visible cause for markets to go lower, and that conditions were due to become more settled with a resulting increase in demand. The markets are bound to be more or less uncertain until quality improves to the extent of making storing a safe proposition. Numerous receipts on the markets are beginning to show better flavor as a result of pastures, and quality should continue to improve right along.

Expert demand has been taking liberal stocks on the distributing markets the past several weeks, but this outlet seems to have slowed up somewhat. Prices offered during the week were so low that dealers were not inclined to accept them. This indicated a feeling that prices were close to the low point.

The average wholesale prices on American cheese (style Twins) for the week ending May 14, 1921, and for the corresponding week a year ago, were as follows:

	Week ending May 14 1921	1920
	Cts.	Cts.
New York	16.9	30.2
Chicago	14.7	27.5
Boston	16.7	30.5
San Francisco	14.4	24.6
Wisconsin	14.1	26.6

The total receipts of American cheese at these markets were 4,482,589 lbs. as compared with 3,905,762 lbs. a year ago and 4,436,700 lbs. a week ago.

New York Butter Market

NEW YORK CITY, MAY 18:—The reasons for the marked shrinkage in butter values are the result of economic conditions which prevail at present. The country has been passing through a period of deflation which has caused the values of practically all commodities to shrink. As usual, at such times, prices of agricultural products fall more rapidly than those in other lines of production. However, in the case of dairy products sentiment has played an important role in forcing butter prices down. In former years, jobbers and retailers have, at this season of the year, been free buyers of butter as they felt that there were but slight risks in accumulating a liberal supply of butter. This year they are buying for immediate needs only as they feel that values may go still lower. On the other hand, wholesalers are anxious to keep their floors cleared at all times as they have no faith in the future of the market. They continue to accept prices for the butter which they have on hand which are lower than the prevailing quotations. That alone is sufficient to cause a weak market.

The speculator as yet has not appeared on the market. While much of the butter that is being received is of high quality and would be satisfactory for storage, the speculator is unwilling to store butter at present prices with the possibility that June prices may be yet lower. There are many receivers, however, who predict that prices are now at the lowest level for the season. On the other hand, there are those who feel that 28c will

Straw:—Receipts are generally light; the demand is fairly active, and prices show but little change. No. 1 wheat straw is quoted as follows: Baltimore $14, Pittsburgh $15.50, Cincinnati $12, Chicago $11.50, Minneapolis $8, Kansas City $8.50; oat straw—Baltimore $16, Pittsburgh $15.50, Cincinnati $12, Chicago $12.50, Minneapolis $9, Omaha $9; rye straw—New York $21, Baltimore $17, Pittsburgh $16, Cincinnati $18, Chicago $13.50, Minneapolis $9.

How to Stop CALF SCOURS

You can do it in a quick, simple, reliable way—costs little. One good calf saved will repay the expense of protecting your whole herd for a long time against this infectious disease.

Leading breeders and dairymen throughout the country say there is nothing like B-K. It contains no poison or acid. It is clear as water and safe to keep anywhere.

B-K acts as an anti acid and sweetener in stomach and also quickly kills the germs that cause scours or diarrhoea. It heals the inflamed membranes, relieves irritation and restores healthy action.

B-K Bacillus Kill

For the Herd

B-K also destroys the germs of the other common cattle diseases, your greatest source of loss.

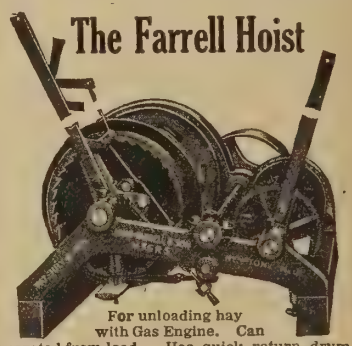
B-K cleanses, soothes, heals, restores healthy action of the organs.

You have this wonderful help **all in one bottle—always ready.** You can't afford to be without a supply always on hand.

Keep a supply of B-K handy for all the "little ills" of the barn—cuts, scratches, anything where infection can do harm.

GENERAL LABORATORIES, MADISON, WISCONSIN.

We will send you on request a bulletin telling you "How to Save Every Calf."



B-K is a pure sodium hypochlorite—every scientific man knows the value.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, MAY 16:—The Volstead bill, which passed the House more than a week ago, is not making any progress in the Senate, and is, at this juncture, the subject of the chief work being done here by the agricultural organizations. This is the bill which authorizes collective marketing of farm products by co-operative agricultural organizations under the inspection of the Secretary of Agriculture, and its passage is held to be essential to the development of the the dairy industry along collective marketing lines.

A peculiar situation exists in the Senate as to this measure. It is being considered by two committees at the same time, and in part these committees have interlocking membership. The Volstead bill was passed by the House without change or amendment as introduced by Representative A. J. Volstead of Minnesota, and is identical in phraseology with the Capper collective marketing bill in the Senate. The Capper bill, when introduced, was referred to the Committee on Agriculture and Forestry, Senator Norris, chairman. This committee is considering this measure.

Members of the Senate who oppose the principle of this legislation to give this special right to the farmers even under adequate supervision, discovered that Senator Capper had made a real point in having the bill sent to the Committee on Agriculture, instead of the Committee on the Judiciary, where it was mutilated in the last session so its sponsors did not recognize and would not accept it. They protested against the reference to the Committee on Agriculture, but it was too late. Their chance came, however, when the Volstead bill was brought over from the House, and they promptly moved that it be referred to the Committee on the Judiciary, catching the friends of the measure asleep, and not represented on the floor, so this reference was made by default. So it now rests. One bill is in the Committee on Agriculture, with Senator Norris vigorously fighting for it; the other, identical, in the Committee on the Judiciary, with Chairman Nelson vigorously opposed to it unless amended, and Senator Norris, a member of the committee.

From a parliamentary point of view the Volstead bill has the superior position, and the Judiciary Committee has already taken it up and referred it to a sub-committee consisting of Senator Dillingham of Vermont, chairman, Senator Norris of Nebraska, and Senator Walsh of Montana. Walsh is strongly opposed to it, Norris is strongly in favor of it, leaving a balance of power in the hands of Senator Dillingham, so far as the committee is concerned.

The importance of this measure cannot be overemphasized. No single industry has started a better nation-wide commodity organization than the milk producers, and this is supplemented by a large number of successful, conservative, and well managed co-operative creamery organizations. But the field is far from completely organized, and no other organizations of farmers have been subjected to the legal criticism, going as far as prosecution, that is met by the milk organizations. It now appears that these organizations are menaced by lack of organization in other and competing territory, and the biggest single handicap, to carrying on these organizations into the competing and unorganized localities, is fear of unwarranted prosecutions under antagonistic interpretation of the anti-trust law. The Volstead bill, if passed, entirely cures this situation; therefore it is vital.

All farmer organizations here are making this their chief point of work now. They are working on three lines, one to secure the active support of the Secretary of Agriculture, one to get the matter to the attention of the President, and to ask him to fulfill platform pledges and make this an administration measure, and the third to bring such evidence of necessity and justice to the attention of members of the Senate, Senators Dillingham, Walsh, and Norris in particular, as will lead to an early report of the bill in the most favorable form possible, and then its correction as to any defects by amendments on the floor, and prompt final passage.

The correspondent for Hoard's Dairyman presents this matter thus fully, and requests that the readers write or wire the members of the Senate from their states, on this Capper—Volstead "collective bargaining for farmers" legislation. A demonstration of the widespread interest of dairymen in this subject will be of great avail.

⚜

Frantic efforts are being made by proponents of the now discredited and practically defeated "sales tax proposition" to get business men generally to "write, wire, or visit" their congressmen, to urge this legislation. The quotation is from an open letter issued by Roger Babson. This letter of Babson's brought a prompt reply from the National Grange, which had long fought the sales tax, which denies the essential facts of the Babson argument, and opines that his friendliness for the sales tax is the strongest argument against it any farmer need have presented to him.

⚜

The subdivision of work on the general tariff bill among sub-committees has given the vegetable oil tariff schedules to a subcommittee of which Hon. Nicholas Longworth of Cincinnati is chairman. Mr. Longworth represents the district where the largest single user of vegetable oils for the manufacture of soap has its plant. Soap makers, like oleomargarine makers, want foreign vegetable oils as cheap as possible, hence the tariff should be as low as possible. Consequently Congressman Longworth is between two fires, the dairy interests, who want a tariff commensurate with the labor cost of these oils in Asiatic countries, and the cottonseed and the peanut growers, who have the same interest, on the one side, and the soap and oleomargarine interests on the other, who do not care about costs of production, but want cheap oils for their own profit here. Comparing national interest and number of people affected, the advocates of a fairly high tariff outnumber the others a hundred to one, but it is unfortunate that Mr. Longworth's congressional district numbers very few of them. The brightest ray of light on this matter is that Representative Green of Iowa is a member of this sub-committee. He knows what a cow is, and what it costs to produce milk and butterfat, and something about how much more valuable and vital these substances are than vegetable oil. If dairymen want to speak where it will do some good on this matter, speak to Mr. Green.

The First

New Jersey State Sale

60 Selected Holsteins

June 9, 1921, AT Trenton

Tuberculin tested and guaranteed under a 60-day retest
Over 80 per cent of the Consignors are under State and Federal Supervision

35 milking cows, 14 heifers, 6 bulls, 5 calves. Bulls from cows above 30 lbs.

One bull from a cow with a long distance record—one cow from a 22-lb. 2-year-old.

A daughter of King of the Pontiacs, a 22-lb. 2-year-old daughter of Spring Farm King Pontiac and Aaggie Pauline Sarcastic, a 36-lb. cow.

A daughter and 2 granddaughters of King of the Ormsbys—A 20-lb. 2-year-old bred to King Model.

All animals were selected on their individuality by the Sales Committee.

70 Holstein Cattle

Indiana's Great Holstein Sale

BY

The Elkhart County Guaranty Sale Company

AT

Nappanee, Indiana, June 9

A great sale because it is a sale of all young cattle, nearly all heifers that have freshened have A. R. O. records ranging from 12 to 25 lbs. of butter and all have the best of A. R. O. breeding.

The great young cow "Pearl Pontiac Hartog" 325738 consigned by Jacob Eby with nearly 25 lbs. of butter and 98 lbs. of milk as a heifer, stands at the head of her class in Indiana.

CAL L. STUCKMAN consigns two sisters, by Prince Pontiac Korndyke, one a 16-lb. yearling that will appeal to any one, the other 16-lb. 2-year-old that tested above 4% for 28 milkings, the pair standing together can hardly be beaten in any dairy barn in the country.

GEO FREESES' SONS consign a 22-lb. cow, "LaCrosse Vale Concordia De Kol 2d", that has real A. R. O. backing to suit a breeder's fancy. She is large and growthy.

There are a number of other good heifers having records from 12 to 15 lbs. Four good bull calves of extra quality by Pabst Champion Adrastus.

Three bulls by Sir Korndyke Matador, one of serviceable age, all these are first class.

DR. HOOPENGARNER consigns a good bull of serviceable age by 19-lb. dam.

Eight heifer calves suitable for Calf Club work as good in individuality and A. R. O. breeding as will be sold in any sale this year.
Two of the first calves sired by the great bull, Segis Pontiac De Nijlander, one of the very largest bulls in service in the state.

Catalog by request.

WESTERN CANADA
Land of Prosperity

offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available **on easy terms**

Fertile Land at $15 to $30 an Acre

—land similar to that which through many years **has yielded from 20 to 45 bushels of wheat to the acre**—oats, barley and flax also in great abundance, while **raising horses, cattle, sheep and hogs** is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living.

Farm Gardens, Poultry, Dairying

are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facitities, rural telephone, etc.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

High Quality — Moderate Prices in Ohio State Holstein Sale

146 Select Black and Whites Make $325 Average

OHIO'S consignment Holstein sale at Columbus, May 4 and 5, was a distinctly creditable advertisement for the black and whites of the state. If the average of $325 was disappointing, the breeders have the satisfaction of having conducted a high class auction where animals sold at moderate prices and of such quality as to bring the buyers back to future sales. The consignments were in sale clothes, in most cases were first class in individuality, and, in their rating for production, were away above the offerings usually assembled for public appraisal.

Ohio boasts 63 "thousand-pound cows"—more than any other state, and leads also in the number of "1100-lb." and "1200-lb." cows. The sale reflected the position of the state in its long time records.

⚜

Bulls sold better than females—eighteen averaging $530 and five going for $1000 or more. Five "thousand-pound" sires sold, said to be the largest number ever put through a sale. Bessie Homestead Oak De Kol, consigned by H. W. King, topped the list, going to G. G. Stetson for $1400. By Oak De Kol Ollie Homestead, grand champion for two years at the National, and out of Jessie Fobes Bessie Homestead, a former 7- and 30-day champion and of unfaulted form, this sire's pedigree brought at least three prospective buyers, one prepared to pay $5000 if his individuality matched his showing on paper. The value set is indicative of the emphasis now given to approved conformation.

King of the Onas, a strongly bred long time production yearling sold by R. E. Dillon, went to Wilber Schumacher for $1,350, the second highest price. Peter Small's single offering, Meadow Holm Jolie Fayne, by Finderne Pride Fayne and out of a daughter of Maple Crest Pontiac Hartog, went to W. B. Cockley for $1,000. Daisy Hill Farms sold a son of King of the Pontiacs Son to C. H. and E. Straight for an equal price, while G. M. Stadelman drew $5 more for a son of Finderne Pride Fayne, John Young buying.

The best bargains were in females, the top value being $925 which John Baltic paid G. M. Stadelman for a daughter of King Ona. Only nine others reached the $500 mark. Among these were two "30-lb." cows taken by Gramling Bros. of Wisconsin for $680 and $625. The great bulk of the consignments stayed in Ohio, Pennsylvania, being the next heaviest buyer, nine head going to Brentwood Farm and eight to H. O. Kimmel of that state.

A pleasant feature of the sale was a banquet gathering of nearly one hundred fifty breeders. Concerning the recently completed membership campaign of the Ohio Holstein Breeders' Association, out-of-state speakers gave the opinion that the association is now the strongest in its organization of those in the country. This view was reinforced by the report made by Secretary H. C. Barker, who had charge of the campaign and who managed the sale.

A list of the purchasers of animals bringing $350 or more follows:

J. L. Layman, Ohio	
Mubroco Cordobia Pontiac 2d	$370
Elm Side Fedora Ona Hartog	480
Daisy Hill Farm, Ohio

Illinois Fair Requires Test

The Illinois State Fair announces that all cattle exhibited at the State Fair this fall must be accompanied by certificates of health before being assigned stalls. These cattle must either have been tested for tuberculosis within 90 days of showing or they must be from federal or state accredited herds. All exhibitors are also required to provide themselves with individual buckets for their respective herds as no public drinking troughs will be permitted. Any cattle that may be shipped to the state fair grounds for exhibition or other purposes and that are not covered by certificates of health will be placed under quarantine and housed under tents.

Many a home is judged by the back yard it keeps.

Planning for the Silo

(Continued from page 783)

exactly the time to settle the silo question, so that you can plan to have crops with which to fill the silo and to feed with the silage?"

"Cracky, I'm glad you mentioned that," said Perry. "I was expecting to start planting corn in a few more days, and this may make some difference in the land that I put in corn."

"Another reason for thinking about silos in the spring," said the cow tester, "is that many farmers in the last few years have been disappointed in last-minute attempts to obtain them or the materials needed for their construction. It is a much safer proposition, therefore, to get your order in now, than to take a chance on a delayed railroad shipment preventing you from feeding silage next winter."

As the men moved toward the house from their seats on the wagon-bed where they had paused to talk, Harry saw in the moonlight Perry's field of alfalfa, whose new growth was starting nicely.

"That alfalfa looks good for a lot of fine cow feed," Harry remarked. "You surely ought to have some silage to feed with it, however. For economical milk production, probably no combination of feeds surpasses alfalfa and corn silage. While grain in addition would permit a larger production, at increased expense, a liberal ration of corn silage and alfalfa will give your cows a chance to show whether or not they are profitable producers. It's hardly fair, either, to test cows without giving them that much of a chance to make good."

"My cows are going to get it," said Newt determinedly. "I'll see about ordering that silo right away."

A little later Harry, flashlight in hand, was making his way upstairs to the Perry family's spare bedroom. "That was easy," he thought, as he undressed for bed; while downstairs Newt sat up studying bulletins and manufacturers' circulars on silos.

Rice County, Minn., Sale

Rice County Holstein breeders held one of the most successful county sales of the year at Faribault, Minn., May 5, the day following the Minnesota state sale. They sold 60 animals for an average of $391, with $900 to high figure.

Chas. H. Miller paid this for Bryonia Mercedes Segis, a 30-lb. seven-year-old granddaughter of Johanna McKinley Segis, consigned by Geo. H. Taylor.

E. C. Schroeder purchased the second highest priced female for $800. She was a yearling daughter of Sir Johanna Glen Ormsby, consigned by H. G. Miller.

Hanson and Hanson did the selling with B. D. Scott in the box.

The following list includes all animals selling for $300 or more and buyers:

Norris Land Co., Minnesota	
Maple Grove Pauline Queen De Kol 2d	$395
Nora Kappijne Spofford	400
Rosa Hartog Maida	300
Elfreth Johnson, Minnesota	
Segis Pontiac Colantha	$600
H. E. Bailey, Wisconsin	
Jack Silver Bell Paul De Kol	$350
H. E. Salsberry, Minnesota	
De Kol Canary Maid	$485
Pine Park Rosa Hartog	315
J. M. Robb, Minnesota	
Prilly Tirania	$475
F. H. Bauer, Minnesota	
Bertha Johanna Countess De Kol	$360
Geo. Caron, Minnesota	
Maplehurst Korndyke Spofford	$300
Tidy Colantha Kathleen	335
Pine Park De Kol	375
Fleck's Korndyke Colantha Heilo	700
N. J. Sargent, Minnesota	
Mabel Homestead Johanna	$300
Starch Bros., Minnesota	
Marie Aaggie De Kol	$300
Chas. H. Miller, Minnesota	
Pearl Fobes Aaggie	$325
Bryonia Mercedes Segis	950
Theo. Filk, Minnesota	
Beauty Thorn Artis De Kol	$400
Vine Creek Ella	300
Rose Ormsby Homestead	300
Ray Luker, Minnesota	
Bonnie Velma Netherland	$600
C. E. Kelsey, Minnesota

New York Butter Market

(Continued from page 792)

be the prevailing price during the storage season.

Of late, there has been some indication that more Danish butter may be forthcoming during the summer months. Reports from Denmark state that England is taking very little Danish butter at present and that butter is accumulating in Denmark as a result. A few small shipments of the butter are thought to be on the water at present destined for this country. It is reported that the Danes are offering quantities of their butter for future delivery at a price of 26c (c. i. f.) but that no buyers can be found in this market. With the enactment of the emergency tariff bill, which carries a duty of 6c on imported butter, it is highly improbable that any Danish butter will be imported during the next few months.

The quality of the butter being received is very high on the whole. The principal defects, from the standpoint of this market, are high color and weed flavors. Receipts are increasing each week with the result that butter is accumulating rapidly. Receivers will be forced to store some of their butter in the near future unless speculative buying becomes operative in the near future. All reports indicate an unprecedented production in all parts of the country. W. B. LIVERANCE.

New York Breeders

HOARD'S DAIRYMAN:—A special effort is being made to increase the membership of the New York State Breeders' Association. This old and useful organization deserves support from all breeders. It was organized in 1887 "to encourage and stimulate improvement in all varieties of pure-bred live stock".

At the last annual meeting in Syracuse provision was made for life membership by the payment of $15. I'm sending out a circular letter to all breeders of pure-bred live stock listed by the State Dept. of Agriculture and inviting them to become members. Any breeder who does not happen to be on this list can get in communication with the organization by writing to the secretary, Albert E. Brown, Agricultural Hall, Albany, N. Y.

HARRY S. GAIL, President.

Walworth County Holstein Sale

Walworth County, Wis., Holstein breeders held their semi-annual spring sale at Elkhorn, May 2, selling 74 head for $13,680.

J. A. Forge, the heaviest buyer, paid the top price of the sale, $550, for Homstafa Pontiac Johanna De Kol, a 25-lb. 6-year-old granddaughter of Sir Korndyke Pontiac Artis, consigned by A. G. Palmer & Son.

T. W. Morrisey was the only consignor, not a farmer, and his success furnishes an object lesson of what can be accomplished with good cattle. He is a blacksmith living in the city with no land except that occupied by his home and small barn. Last fall he purchased two registered cows for a total of less than $500. Both freshened in the winter dropping heifer calves. He and his 14-year-old son tested them, their first attempt, the cows making 21.19 lbs. and 25.37 lbs. butter respectively. They sold milk enough at the creamery to pay all feed bills and the 4 head at the sale brought $1,270, a very substantial profit.

Mack and Haeger did the selling with J. G. Voss in the box.

Following is a list of those animals selling for $300 or more and buyers:

Fred Gurr, Wisconsin	
Walcowis Ollie Burke	$310
Harry Ellsworth, Wisconsin	
Walcowis Mooie Inka	$430
Adam Michel, Wisconsin	
Walcowis Viletta Walker	$360
H. E. Culver, Wisconsin	
Kayewood Lyda Pontiac	$320
Geo. H. Bie & Sons, Wisconsin	
Black Point Phyllis Pontiac	$350
Duchess De Kol Johanna Ormsby	455
J. A. Forge, Wisconsin	
Homstafa Pontiac Johanna De Kol	$550
Maywood Sadie Segis	305
Canary Johanna Ormsby	500
Aaggie Orieans Pietertje	495
Highland Agatha Ormsby	355
J. H. Henderson, Wisconsin	
Daisy Colantha Korndyke 2d	$300

THE THIRD

National Ayrshire Sale

Springfield, Massachusetts

Tuesday, June 7th, 1921

On the day before the Annual Meeting of the Ayrshire Breeders' Ass'n

Rob Roy Farm Ayrshires

Auchenbrain White Beauty's Good Gift

AUCHENBRAIN WHITE BEAUTY 2D

Having sold my farm, I will sell at private sale my entire herd of Ayrshires consisting of 33 head and including White Beauty's Good Gift, 18057, the only living son of the world's champion Auchenbrain White Beauty 2d, the greatest Ayrshire cow living, whose sire was Imp. Kate's Good Gift, 15426, and whose dam was Imp. Auchenbrain Brown Kate 4th with a milk record of 23,022 lbs. and a butter record of 1,080 lbs. This bull shows the vigor and elasticity of a two-year-old, has a good disposition and is a sure and quick stock getter. He is guaranteed absolutely free from tuberculosis, having passed three successful tests within the past year. With him are 20 of his daughters, ranging from three months to three years old, and 4 of his sons, ranging from three months to a year old, all of the choicest breeding and many from A. R. O. dams. Herd free from tuberculosis and contagious abortion and will be sold subject to Federal test if so desired. Here is the chance of a lifetime. Come and see them and get your first choice. I must sell.

J. W. MUDGETT, **Ellicottville, New York**

WENDOVER FARM

CONSIGNS TO

Third National Ayrshire Sale
Springfield, Mass., June 7th

Baron's Dainty A six-year-old Cow whose senior four-year-old record in 342 days is 10,549.3 lbs. milk, 402.98 lbs. fat. She is a big, stylish Cow of correct Ayrshire type, with very large teats, splendidly placed on a large, square udder.

This great Cow is by Baron's Best of Bargenoch, sire of 25 A. R. daughters with 30 records averaging 10,246 lbs. milk, 407.02 lbs. fat, and including Highland Polly which sold for $7500 in the First National Ayrshire Sale. She is out of Picken's Dainty 2nd, A. R., 11,749 lbs. milk, 506.42 lbs. fat, out of Picken's Dainty with six Scotch records.

Baron's Dainty was bred September 3d to the Grand Champion, Admiral Beatty of Wendover.

COWS ON ADVANCED REGISTRY TEST ON WENDOVER FARM. OUR CONSIGNMENT TO THE NATIONAL SALE MAINTAINS THE HIGH AVERAGE QUALITY OF THE HERD.

Wendover Farm, Bernardsville, New Jersey

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Short Course Great Success

Drawing of Guernsey and Holstein Calves is a Feature

HOARD'S DAIRYMAN JUNIORS:—One of the most successful, as well as important, farm gatherings ever held in the county was the boys' and girls' club short course held at the county seat recently under the direction of the farm bureau. The short course was attended by about 75 boys and girls who have enrolled in the various pig and calf contests organized by the farm bureau.

The purpose of the course was to give these Minnesota boys and girls instructions calculated to help them in caring for and feeding their pigs and calves so as to make the various contests bring better results.

It was certainly a splendid way to encourage these boys and girls in their farm work and was certainly calculated to arouse in them a greater interest in farming. Between 80 and 90 of these boys and girls are enrolled in these various contests. Each boy and girl is raising a pure-bred pig or calf. The rules governing the contests are definite and calculated to stimulate not only an interest in better stock, but better care of the stock. These contests involve exhibitions at the county fair and lead up to entries at the state fair by the county fair winners. State fair winners then go to the International Live Stock Show in Chicago.

In order to still further assist these boys and girls and thereby stimulate and help live stock farming in the county, a club leader has been secured. His name is Mr. Morton Peterson, from the State Farm School, and during the six months he will work he will visit the boys and girls regularly, check up their work, and offer what services seem to be necessary in order to help them along. All this work, including the organization of the clubs, securing the pure-bred animals, arranging the short course, and the engagement of the county club leader was done by the farm bureau. The salary and expenses of the club leader are paid in part by the national government, the Long Prairie high school, and by private subscription. None of the expense comes out of the farm bureau treasury.

The short course sessions were held at the Long Prairie high school building and began Thursday afternoon. Instructors in charge were R. H. Giberson, who is the state club leader; K. Warner, Joseph Montgomery, L. V. Wilson, and Axel Johnson. Mr. Warner gave demonstrations in beef cutting, Mr. Montgomery lectured on beef animals, Mr. Wilson lectured on dairy animals, and Mr. Johnson lectured and held classes giving instructions about the pigs.

Friday afternoon the entire class was taken in automobiles to the C. F. Miller farm, where using Mr. Miller's prize Shorthorn bull as an example, Mr. Montgomery gave a short lecture on beef judging and how to select a beef animal. The party was then taken to the Bemis and Gutches farms in Reynolds, where Mr. Wilson gave a short lecture on how to judge dairy cows and bulls, using animals from each farm as his illustrations. Returning to Long Prairie at 4:30 the boys and girls were entertained at a special movie show at the Cozy Theatre. Friday evening a program was given for them at the high school, consisting of music, recitations, and addresses by E. A. Williams and C. D. Chrysler. Both gentlemen emphasized the value of farming and the importance of the work which the boys and girls were doing. The musical numbers were Floyd Maynard, Miss Wilma Lee, and Mrs. Rudolph Lee. Miss Marie Clemmensen recited. Each of the school sessions was preceded by a program of class singing led by A. H. Fish, director of the Long Prairie Band. Miss Wilhemine Frana assisted as accompanist and the boys and girls were taught a number of rousing songs.

Saturday morning, after the class work had been completed and various matters of business attended to, the members who were to receive Guernsey and Holstein calves drew their calves. The sessions adjourned at noon. During the time the boys and girls were in Long Prairie they were entertained at various homes in the village.

The drawing of the calves was one of the most interesting incidents of the short course. There were 23 calves, 9 Guernseys, and 14 Holsteins. All were pure-breds of excellent breeding. The Guernseys were selected by County Agent Ausen, E. H. Bemis, and August Loegering, and were bought at farms in the neighborhood of Eau Claire, Wis. They were shipped here last week, E. H. Bemis making the trip with them. The average cost of these Guernsey calves laid down here in Long Prairie was $151. The Holsteins were selected by County Agent Ausen and M. E. Gutches and were purchased at farms in Southern Minnesota. The average price of the Holstein calves was $225. These calves were either purchased outright for the boys and girls by their parents, or were given to the boys and girls on contracts made with the Guernsey association or the Holstein association, in which the calves are to be paid for, bred at the proper time, exhibited at the county fairs, and paid for within three years.

A great many of the pure-bred hogs were secured at the Duroc sale recently held in Long Prairie, while the other animals for the boys and girls of the contests were secured direct for them by their parents or by individual purchase from county breeders. The drawing of these 23 calves took place at 10 o'clock and was witnessed by a large number of people. After the drawing, pictures were taken of the party and a parade of the youngsters and their calves was made through the business section of the village.

Before the classes adjourned a Junior Live Stock Breeders' Association was organized, with officers as follows: President, Cleon Bemis; vice-president, Claude Larson; secretary-treasurer, Mildred Sargeant.

It was voted to have the board of directors made up of one representative from each township in the county. It was agreed that where there were five or more members in any township these members should elect the township director. If there are less than five members the president of the association will appoint the director for that township. Membership fees were placed at 25c per year and every boy and girl in the county who is interested in better live stock is invited to join. The address of the secretary, Miss Mildred Sargeant, is Long Prairie, Minn., Route 3. Very probably the first work of the club leader, Mr. Peterson, when he arrives will be to get in touch with the directors of the Junior Live Stock Breeders' Association and through them begin his work.

Minnesota. J. AUSEN.

THE HOLSTEIN GROUP

Grass

An Agricultural Literary Gem

Next in importance to the divine profusion of water, light and air—those three physical facts which render existence possible—may be reckoned the universal beneficence of grass. Lying in the sunshine among the buttercups and dandelions of May, scarcely higher in intelligence than those minute tenants of that mimic wilderness, our earliest recollections are of grass. And when the fitful fever is ended, and the foolish wrangle of the forum and market is closed, grass heals over the scar which our descent into the bosom of the earth has made, and the carpet of the infant becomes the blanket of the dead.

Grass is the forgiveness of Nature—her constant benediction. Fields trampled with battle, saturated with blood, torn with the ruts of cannon, grow green again with grass and carnage is forgotten. Streets abandoned by traffic become grass grown,

THE GUERNSEY GROUP

like rural lanes, and are obliterated. Forests decay, harvests perish, flowers vanish, but grass is immortal. Beleagured by the sullen hosts of winter, it withdraws into the impregnable fortress of its subterranean vitality and emerges upon the solicitation of spring. Sown by the winds, by wandering birds, propagated by the subtle horticulture of the elements, which are its ministers and servants, it softens the rude outlines of the world. It evades the solitude of deserts, climbs the inaccessible slopes and pinnacles of mountains, and modifies the history, character, and destiny of nations. Unobtrusive and patient, it has immortal vigor and aggression. Banished from the thoroughfare and fields, it bids its time to return, and when vigilance is relaxed or the dynasty has perished it silently resumes the throne from which it has been expelled but which it never abdicates. It bears no blazonry of bloom to charm the senses with fragrance or splendor, but its homely hue is more enchanting than the lily or the rose. It yields no fruit in earth or air, yet should its harvest fail for a single year, famine would depopulate the world.—J. J. INGALLS.

Junior Letters

Hoard's Dairyman Juniors:—We are milking twelve cows at present and feeding eight calves. We have four heifer calves and four bull calves.

We are going to take six head of cattle to the county sale at Oshkosh.

Have any of you juniors any rabbits? If anybody has some please send me a letter and tell me what you feed them.

We are going to have a calf club meeting at our school. I got my four H pin from Mr. Bewick for joining the calf club and sending in my record book.

We are going to take our examination in school about the 10th of May. I have to write in arithmetic, reading, grammar, history, agriculture and spelling.

Wishing all the juniors good luck.

My address is Pickett, Wis.

Melvin Miller.

Hoard's Dairyman Juniors:—I thought I would write you a few lines to tell you about my new home. I like it very well. I have a lot of work to do here but I keep right after it and so it isn't long until I am all done.

I get up at 5 o'clock in the morning. After I get up I go to the barn and get the milking machine and then I go and put it on the cows. I have the job of running the milker. And I am going to school now. I like school very well.

I would like very well to hear from you often. My address is R. 5, Coldwater, Mich.

My father has been looking around for a pig but he hasn't found any yet. I thought I wouldn't sell my two pigs I had but my father said I could sell those two and then buy me another one. Those pigs I had brought $10 when I sold them; they were only fall pigs.

Harold Stout.

Hoard's Dairyman Juniors:—I enjoy very much reading the junior page in Hoard's Dairyman and especially the letters from the boys. It has occurred to me that perhaps other boys would be interested in reading a letter from me.

I am 13 years old and attend the Rudolph graded school.

I live on a 200-acre farm one mile from Rudolph station and 9 miles from the city of Wisconsin Rapids. Wisconsin Rapids is on the Wisconsin river. No doubt all of you have learned about this river in school. It is a strong, swift stream and furnishes excellent water power which is used mostly by the paper mill companies and for electric power and light. There are eight large paper mills on the Wisconsin river near here.

On our farm we keep six work horses and a saddle pony which belongs to me. We have more than forty head pure-bred Holstein cattle and about thirty pure-bred Chester White hogs and pigs. We also keep chickens, geese, and turkeys.

My father has been on the farmers' institute force for the past three winters. When he is away I have to get up earlier than otherwise and help with the milking.

Last year and the year before I raised a pig. The two brought me $58.50. About half of this I paid out for feed and the little pigs. This year I am going to raise two pigs. Hogs are so much lower in price now than they have been that one must have more of them to get anything out of it. My father is giving me the pigs this year for the extra chores I did last winter when he was away. He will give me what whey I need for hauling the milk to the cheese factory during the summer. He will also give me free pasture as he says well fed pigs improve the land enough to pay rent.

Well I think this letter is long enough for the first time. As Hoard's Dairyman has been in our family ever since the first issue was published it is not necessary to say what we think of it.

With best wishes to all of the boys who read this page.

Carl Imig.

Wisconsin.

Hoard's Dairyman Juniors:—I am 8 years old and am in the third grade at school.

I live on a 150-acre farm. We have four horses, thirteen cows, one bull, three yearlings, and three calves. Two of our cows are registered, the rest are grades.

We have about 60 Rhode Island Red chickens. Our chickens average about 40 eggs a day.

If any of the juniors wish to write to me, my address is Pattersonville, New York.

Wishing all the juniors good luck.

George I. Wilcox.

Hoard's Dairyman Juniors:—I live on an 80-acre farm and go to school. I have not missed a day this year. I hope I will pass the second grade. I am eight years old. We have 19 head of full blood Brown Swiss cattle. We have 3 horses. Our silo is nearly empty and our silo is 12 by 34. We have 50 hens. I have one sister and her name is Luella and a brother whose name is Roland.

John F. Krauss.

Michigan.

Hoard's Dairyman Juniors:—I am 12 years old and have passed the 8th grade. My brother takes the Hoard's Dairyman and I like to read the letters from the other children. I have 50 hens and 60 chickens. I have two Holstein calves which I got at a calf club last year. My brother joined the corn club last year and got third prize. He might have got more but the hail injured the corn.

My father owns two hundred acres and also rents some. We have a tractor and a car. We have 41 pigs and 13 thoroughbreds. My chickens brought me $30 last year.

I like a farm better than the city because I think children can learn more useful things on the farm.

Ruth Birdsell.

Iowa.

Hoard's Dairyman Juniors:—I have been reading the junior letters every week. I always read the junior page and like the stories very much. We have 16 head of cattle, 12 cows, one heifer, a bull, and 2 calves. We are only milking three cows now. The average test for the herd this winter was 5% butterfat. I have no calf but expect to get one. My brother and sister and I have a sow and six pigs. I sold four the other day. I am keeping one. He is doing fine. I feed them about 5 quarts of skim and new milk at a meal and one quart of ground corn, oats, and wheat with a little ear corn. The pigs are Hampshires and Durocs and are 8 weeks old. I am getting 50 Ancona chicks next week.

I haven't got my truck patch planted yet. We are through plowing for corn and have our 24 acres of oats sowed. There will be 30 for corn. I like dairying the best of all things. I also like stock raising.

If any of the juniors want to write to me my address is R. 1, Smithville, Ohio.

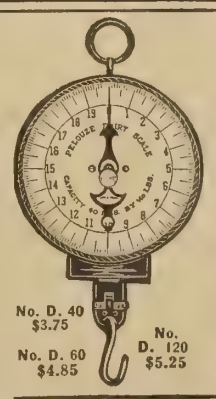
Leslie Switzer.

"Unfading in Beauty—Unfailing in Service"

A MORE FITTING description of MULE-HIDE Shingles and Roofing would be hard to find.

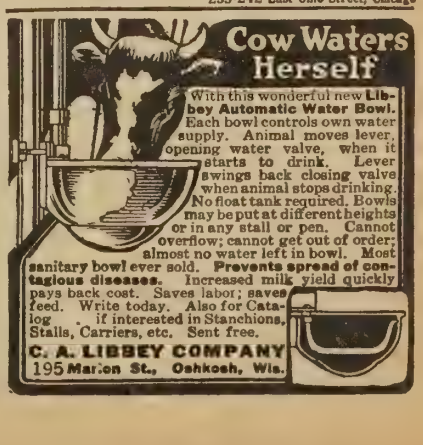
That phrase defines the most and the best in roofing protection—the combination of lasting good looks and service of the year-in-year-out variety.

"The proof of the pudding is in the eating," of course, but as the manufacturer of an automobile comparable in merit with MULE-HIDE puts it, "Ask The Man Who Owns *Some*"—there you'll get the proof that will induce you, too, to be content with just one roofing, the one with the service record—



"Not a Kick in a Million Feet"

Ask your dealer to show you samples of MULE-HIDE products. They are listed below.



MULE-HIDE Smooth Finished Roofing.
MULE-HIDE Slate-Kote Roofing furnished in Green and Red Slate.
MULE-HIDE Shingle-Craft Roofing furnished in Green and Red Slate.

Brown County, Wis., Sells Holsteins

The Brown County Holstein Breeders' second annual sale held May 9 at De Pere, Wis., brought out a very large crowd but not all of them were buyers. As a consequence selling was slow, the 87 head bringing just short of a $200 average.

One of the Murphy Farm's consignment topped the sale at $1,500. It was a 2-year-old son of The Mighty Monarch from a 37-lb. daughter of King Lunde Pontiac Korndyke. He was purchased by N. J. Lossetzong, Wisconsin.

Haeger & Kelley did the selling with Francis Darcey in the box.

Following is a list of those animals selling for $250 or more and buyers:

H F. Wittig, Wisconsin	
Dutton Canary De Kol	$270
E. C Pasch, Wisconsin	
Pauline Vickery Wa Wa De Kol 2d	$265
Peter Balten & Son, Wisconsin	
Duchess Tenia Ripon 2d	$285
E. G. Carpenter, Wisconsin	
Bloemtje Johanna De Kol	$255
Crescent Bessie Pet Johanna	$280
John Duggan, Wisconsin	
Bloemtje Queen Segis	$300
Ben King, Wisconsin	
Crescent Bessie Pet Segis	$425
Ashburn Segis Pontiac Loma	365
Anton Bartin, Wisconsin	
Elmwood Colantha of Midway	$460
Frank Smith, Wisconsin	
Elmwood Segis Nemo	$415
Frank Bressnick, Wisconsin	
Elmwood Rag Apple Lady	$255
John W. Coenen, Wisconsin	
Elmwood Rag Apple Queen	$300
Otto Durckey, Wisconsin	
Prilly De Kol Pontiac 2d	$600
Lady Sarah Pontiac 2d	330
Jas. W. Byrne, Wisconsin	
Abbekerk Pontiac Lyons Segis	$500
Jno. W. Lanier, Michigan	
Maud Twist Colantha 2d	$285
Chas. J. Konaps, Wisconsin	
Johanna Segis Piebe Pontiac	$275
Geo. A. Friederici, Wisconsin	
Queen Segis Hengerveld Lass	$290
N. J. Lossetzong, Wisconsin	
Monarch Korndyke	500
M. Dillon, Wisconsin	
West Street Pontiac Good Hope	$390

Indiana Guernsey Show

The Boone County Guernsey Calf Club will hold its third annual show at Lebanon, Ind., June 4th. This promises to be a real gala day for the Guernsey enthusiasts. About eighty Guernseys will be shown by the boys and girls and the ribbons will be placed by a judge of national reputation. Several of the animals that will be shown received high placings at the Indiana State Fair last year, and one won third place and another fifth place at the National Dairy Show at Chicago, in competition with the best Guernseys from all parts of the United States. Some of the boys and girls who did not show their animals last year are putting them in the best of condition for the show on June 4th in order to share honors with the winners of last year.

Guernsey breeders and Guernsey enthusiasts from all parts of the country are planning to attend. The Indiana Guernsey Breeders' Association will have a field meeting in connection with the show. Mr. A. J. Glover, managing editor of Hoard's Dairyman, and Mr. Farrell of Washington, D. C., head of the Boys' and Girls' Club Work, will speak. Professor Karl Musser, field representative of the American Guernsey Cattle Club, will be present.

C. R. GEORGE, Secretary.

MORE THAN HALF WHITE

Handsome YOUNG BULL

Born Dec. 10, 1919. Sire a son of a three time 32-lb. cow (best record 34.14) with ten months record of 20,022 lbs. milk, 903 lbs. butter. He is now in Wisconsin with unusual opportunity of developing into a great sire. Dam, 236-day record as a junior three with first calf, 10,507 lbs. milk, 466.4 butter. She a granddaughter of Dutchland Creamelle Korndyke Lad, her half sisters all proving heavy milkers with us, and she has seven dams with over 1,000 lbs. butter in a year. Price, less than the cost of growing him. $250.

AVALON FARMS,
E. D. Curtis, Owner, Bantam, Conn.

For Sale

Holstein bulls from 8 to 16 months old, from A. R. O. daughters of Sir Mooie Oak De Kol No. 41220 and sired by Sir Bess Fayne Pontiac Ormsby No. 206924. Splendid individuals at reasonable prices.

Von Wald & Bavernfeind, Nerstrand, Minn.

A FEDERAL ACCREDITED HERD OF

A. R. O. Holstein-Friesian Cows and Heifers

OFFERED AT PRIVATE SALE

One or a carload. Herd consists of twenty-three young cows, all fresh since December, now milking from 50 to 100 lbs. per day. All have A. R. O. records, from 14 lbs. as yearlings to 25 lbs. as 3-year-olds. Several bred to a 32-lb. sire, his dam having a record of 32.22 lbs. in seven days and her sire out of a (31-lb. seven-day, 1,076 lbs. for year) daughter of that great century sire "Hengerveld De Kol". These cows are very good individually, good size, and are real producers.

Twenty heifers from two to ten months old, very well grown, good condition, and good straight individuals, all sired by 27- to 34-lb. sires, and many from dams with records to 25 lbs. This herd was Federally tested April 1st, 1921, as well as March 29th, 1920, with no reactors.

If you want some real foundation animals, that carry many crosses of century sires, of proven transmitting ability, come and look them over and take your pick. They are priced to sell.

BLUMECREST FARM, MAPLE LAKE, MINN.

Binder Prices Have Been Reduced

McCormick · Deering
Milwaukee

Now—as to Harvest Time!

THE BINDERS of the nation must come out at harvest time and transform a billowing acreage into a great stubble field ready for the plow. This is a necessity of the near future and every individual farmer must be ready with men and machines to save all the yield of his own fields. Will your present equipment do the right thing for you? We call to your attention the standard binders of the nation.

McCormick · Deering · Milwaukee

are time-tried names, favorably known wherever there is agriculture. Grain binders with these familiar names will demonstrate again that nearly ninety years of harvesting machine development and satisfactory service in the fields of the world stand behind them.

Timely repairs may be your solution for this harvest, but to limp through the season with machines that are truly outworn will prove disastrous. No farmer can afford to run a binder that has served too many years, nor can he practice true economy with a small, inadequate machine if his acreage and power equipment demand an 8-foot binder.

As harvest time approaches, take careful account of your equipment needs, then see the International dealer. He has **McCormick, Deering** and **Milwaukee**—the binders that are guarantees of high quality and operating efficiency.

"Perhaps You Don't Know"

says the Good Judge

How long a little of the Real Tobacco Chew will last.

Nor how much genuine chewing satisfaction the full, rich real tobacco taste will give.

Ask any man who uses the Real Tobacco Chew. He will tell you that this class of tobacco will give more satisfaction—and at less cost—than the ordinary kind.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 1107 Broadway, New York City

The Farmer and His Business

(Continued from page 779)

barn this year and get a few pure-breds next year and pay off some of the mortgage after harvest. I would carry out the whole program but I simply cannot. I get up early and I work late. My family and I live just as simply as we can. We do not waste anything that we can help. But in spite of our good crops last year we can do none of these good things. Interest and taxes and the bare necessities of life leave us nothing with which to make progress. We are fortunate to break even. Many cannot even do that."

Well, make a little progress anyway. If you can't build a new barn, make a much needed but inexpensive shed for your farm machinery. If you cannot buy the better cows perhaps you can obtain a little better results from the old ones. If you keep on wanting the barn and the pure-bred cows you will be very likely to get them within a reasonable time. It is surprising how determination can accomplish the impossible. The trouble with some of us is that we don't really want things bad enough. It is not necessary to advise you to work longer hours. You are already working too hard. But you may be able to put a little more of yourself into the tasks you are doing. You may be able to polish up your ideals a little and work more steadily toward them. You may be able to be a more all-around good fellow, a healthier, happier man. You may put yourself into better shape to win.

We raise winter wheat here in Kansas. It is sown in the fall in time to get a good start before cold weather. Through the winter it ought to become a little thicker and better rooted, but we do not expect much growth. That is not necessary. If spring finds our wheat alive and in good condition there will be plenty of time for growth and a good crop. Do you see what this illustrates? After a man has begun his business life, has made his plans and his first investments, there is apt to come a period of drudgery, of slow growth, a testing period when his character may grow strong but his business growth is very slow. It takes a finer devotion to make good in such a time than when things are rapidly moving along. But as in the case of the wheat we may look forward to a season of more favorable weather and rapid growth. The important thing for us is to be then in condition to grow.

We do a lot of thinking in terms of dollars. Two farmers die leaving estates of fifty thousand dollars apiece. Our first casual thought is that they were about equally successful. One of these men accomplished little that was worth while. He inherited a good deal of money and held onto it. The other man was a constructive farmer, working out his ideals for fifty years. A friendly man, a useful citizen. At once we recognize that these men did not die as equals. Had the second man left an estate only one-fifth as large as the other, he would still have lived the greater life.

We may not realize it, but under our desire for business success there is the desire for character, manhood, brains, ability. We desire success in a large measure so that we may prove to ourselves and our friends and our children that we have these qualities. It is a pretty fair test too. The line of work into which a man puts the best there is in him naturally ought to show. But as we do put the best there is in us into the struggle against adverse circumstances, whatever they are, we are progressing toward real success. And if we realize these underlying principles and live normal, healthy lives and meet our duties as they come to us with a forward, hopeful look we may have the enthusiasm that is born of success without the pang that false success gives.

Mr. Average Farmer, I should not be surprised if you are making a great success of life and you secretly feared that you were making a failure.

Remedy for Calf Scours

HOARD'S DAIRYMAN:—In treating calf scours I set the milk as we used to before the advent of the separator, skimming morning's milk in evening and vice versa. This is then pasteurized and fed at the temperature of the mother's milk, adding a teaspoonful of camphor. Also give the calf a slice of toasted bread in the milk. Ordinarily a little camphor in the usual feed is sufficient; but if the passages have a disagreeable smell, withhold a feed and give two tablespoonfuls of castor oil.

Platteville, Wis. J. N. McL.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Scours of Calves

Calves would be less commonly attacked by diarrhea, popularly termed "scours", did feeders more closely copy Nature's methods. The average man or boy is a poor "wet nurse" anyway, and it would be a blessing to calves could women invariably do the feeding. As it is now, calf feeding often is a much disliked "chore", done under protest and in a careless or thoughtless way. Twice daily a big pail of milk that often is too old, too cold, foamy, slightly soured, or contaminated with germ-laden dust is held for the calf to drink. And the calf, looking out of the corners of its eyes, sees that it is a "hurry up call", and that the milk must be guzzled down in short order if it is to be had at all. That sort of feeding is all wrong and scarcely can help causing derangement of the digestive organs characterized by scouring.

Nature's plan is far different. Only the fourth compartment (abomasum) of the young calf's stomach is developed at first and its function is to receive and deal with small quantities of pure, blood warm milk at short intervals. Rennet is prepared from the calf's fourth stomach as rennin secreted there is the milk curdler acting in conjunction with hydrochloric and lactic acids. The nursing calf sucks warm milk frequently in amounts that can perfectly be cared for by the stomach and digestion consequently proceeds undisturbed. But when a big quantity of skimmilk, in the improper state we have mentioned, suddenly enters the abused stomach and the process is repeated twice a day, derangement inevitably results and the calf suffers from diarrhea.

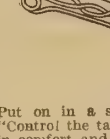
Germs from contaminated milk and dirty feeding utensils unquestionably help to derange the digestive organs, but erroneous methods of feeding are quite as injurious. A calf that is gulping down cold milk sometimes suffers a fit and falls in convulsions. Should this happen repeatedly death results. In our opinion the cause is a spasm of the gullet induced by fast drinking and the fit is a reflex result. It would be well indeed could the calves that do not nurse always be fed milk from a self-feeder. Such appliances are on the market but the work necessary to keep them clean and sweet has kept them from coming into general use.

To prevent scours, calves should so far as possible be fed at shorter intervals smaller quantities of fresh, sweet, clean, foamless, blood warm milk from a pail that has been scrupulously cleansed, scalded, and sun dried. By allowing some relished meal just after feeding milk and while still confined in stanchions, calves will largely be prevented from sucking one another's ears and udders, and not until calves are several weeks old should solid feed be allowed. If a calf starts scouring it should instantly be isolated and the pen cleansed, disinfected, and freshly bedded.

Every feeder has a favorite remedy for scours. As a rule it usually is well to give a dose of castor oil in milk before astringent medicines are administered. A teaspoonful of a mixture of half an ounce of formaldehyde and fifteen and one-half ounces boiled water added to each pint of milk fed daily helps when diarrhea is prevalent. A mixture of 1 part of salol and 2 parts of subnitrate of bismuth has given good results. The dose is 1 to 2 teaspoonfuls 2 or 3 times daily, according to the size of calf and severity of attack. Triple sulpho-carbolate tablets will also be found effective. Lime water added to milk and blood meal to the meal ration also help.

Lice

I have a colt that has lice. Is there some kind of powder to put on him?
Wyoming, Minn. D. J. T.



When the weather is too cold to allow use of a liquid, the infected parts should be well dusted with a mixture of equal quantities of pyrethrum and flowers of sulphur. Then blanket the animal. Repeat the treatment as often as seen to be necessary. When weather moderates, wash the infected parts with a tea made by boiling 4 ounces of stavesacre or larkspur seeds in water for 30 minutes. Repeat applications as found nccessary. The stable should also be cleansed and disinfected.

You can't do two things at once. If the best growing conditions are wanted in a woods, grazing animals must be kept out. Hard trampling of soil does about the same amount of good in a woodlot as it does in a field of growing corn.

MIDDLESEX MEADOWS FARM
OFFERS
Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.
No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.
Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we KNOW you can't get as good as these two for any less money elsewhere.
A. Henry Higginson (Owner). W. R. COUTTS, (Supt.)
South Lincoln, Massachusetts

JAMISON BROS., Appleton, Wis.

Southern Wisconsin
Guernsey Breeders' Sale
Fort Atkinson, Wis., June 7

Here are ten reasons why YOU should attend this sale:

1. Because there are 70 head of select individuals from the leading herds in Southern Wisconsin to be sold.
2. Because each animal in the sale was chosen by a sale committee composed of competent breeders.
3. Because 75% of the animals to be sold are from herds under Federal Supervision.
4. Because, from the point of individuality, breeding, and ability to produce, these animals will be a credit to any herd.
5. Because each animal is consigned by a reputable breeder who will stand back of his consignment.
6. Because there are animals consigned from some of the oldest herds in Wisconsin, that have never before consigned animals to a public sale.
7. Because Fort Atkinson is the center of one of the oldest Guernsey communities in the state where there are many herds well worth seeing.
8. Because Fort Atkinson, to a dairyman is a most interesting town. Probably no other has furnished as much dairy inspiration.
9. Because a visit to the Hoard's Dairyman plant and farm will reward any one many fold.
10. Because a trip through the James Manufacturing Company's new plant and the Creamery Package Manufacturing Company's factory is equally interesting and instructive.

A Few High Spots in the Breeding of the Animals Consigned:

An A. R. daughter of Princess Deasie's Son, Junior Champion at the Wisconsin State Fair, 1915. His two nearest dams average 788.69 lbs. Out of Princess Deasie (687.80 lbs. fat) former Class Leader, she, a daughter of Imp. Queen Regent IV (889.57 lbs.).

A daughter of Hope's May Rose of Maple Hill, an A. R. son of Lady's Hope of Maple Hill (776.63 lbs.) who holds 7th place in Class D, a daughter of Norwood Lady Makefield.

Two full sisters, daughters of Sir Snowdoun and Galaxy's Beauty, a granddaughter of Imp. Galaxy's Sequel.

A daughter of Dora's boy of Sunny Valley (3 A. R. daughters) a son of Lord Waukesha and Royaline's Dora (717.31 lbs.).

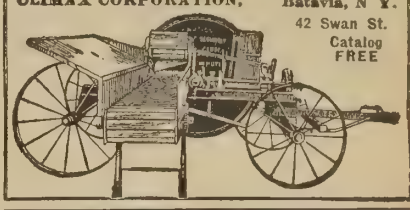
An A. R. daughter of Langwater Hambro, an A. R. son of Langwater Hayes Rosie, (645.-50 lbs.) and Dolly Dimple's May King of Langwater, sire of Langwater Nancy, (1,011.66 lbs.).

Four daughters of Bob Rilma's Monogram, whose dam and grandam average 887.83 lbs. fat. He is by Bob Rilma, Junior Champion bull at the National Dairy Show, 1912. Bob Rilma is out of the former Champion Dairy Cow of all breeds, May Rilma (1,073.41 lbs.).

Three daughters of Giltedge of Koshkonong Place, sire of 13 A. R. cows. He is a grandson of Masher and Imp. Galaxy's Sequel.

A daughter of Royal Rose King of Edgemoor, a show bull, out of Belladia (934.05) and by Imp. Itchen May King, senior and grand champion at Pan Pacific International, 1915. He has 29.69% May Rose blood. Sold for $6,100.

Florham Victor, a son of Ne Plus Ultra whose first 12 daughters to freshen average 516.32 lbs. Sire of 3 Class Leaders. Full brother to Itchen Daisy's May King of Langwater, a $30,000-bull.



Upland Penetrator, a son of Langwater Cavalier, whose first six daughters to be tested average 608.34 lbs. fat at an average age of 2 years, 6 months. A son of Dolly Dimple's May King of Langwater. Dam out of a former Class Leader, Imp. Bijou des Frances (943.41 lbs.).

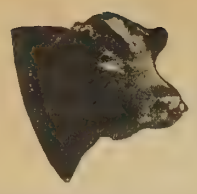
Easy Now to Rid Your Farm of Rats

Wonderful Discovery by Noted Scientist Kills Every Rat Within a Week's Time—Not a Poison

Rats cost farmers over two hundred millions of dollars a year, through the destruction of grain, poultry and buildings. Farmers need no longer suffer this loss because they can now kill off all the rats on their farm in less than a week's time. This is possible through the remarkable discovery of E. R. Alexander, a Kansas City chemist, who has perfected a virus which kills rats, mice and gophers as though by magic. This product is not a poison—it can be eaten by human beings or any animal on the farm as safely as their regular food, but means quick, sure death to rats.



This wonderful rat virus, which is known as Alexander Rat-Killer, is merely mixed with bread or meat scraps and placed where rats, mice or gophers can get to it. Within a few hours after a rat has eaten Alexander Rat-Killer he gets a high fever and suffers a terrible thirst. He leaves the barns and nesting holes and goes to the open field in search of pure air and running water. Rats and mice affected always die away from the barns and houses, so there is no odor.

It is a scientific fact that one rat affects others and soon the whole colony leaves the buildings and dies. And though this virus is absolutely deadly to rats—chickens, hogs, cattle or any farm animal can eat it and not be affected at all.

So confident is Mr. Alexander that Alexander Rat-Kill will kill every rat on your farm in less than a week's time that he offers to send, as an introductory offer, a regular $2.00 tube for only $1.00. Give it according to directions, and if at the end of a week's time you are able to discover any rats, mice or gophers on your farm, your money will be refunded. A big Kansas City bank guarantees that Mr. Alexander is reliable and will do as he says.

Send NO MONEY. Just write to E. R. Alexander, Alexander Laboratories, 137 Gateway Station, Kansas City, Mo., and the tube will be mailed at once. When it arrives, pay the postman only one dollar and postage on the guarantee that if not absolutely satisfactory your money will be returned without question. Write today—a postcard will do—and stop your rat losses now.

Economy in Production ← GUERNSEYS → Quality of Products

The Guernsey is a medium sized cow that produces with greatest profits large quantities of milk and butterfat of the highest quality. She is exceptionally gentle and responds promptly to good feed and care. Send for our free literature.

Cost of Marketing Milk

The cost of a quart of milk to the consumers of Columbus, Ohio, during the first six months of 1920 ranged from 11.3 cents up to 15.3 cents, according to figures announced by the United States Department of Agriculture. The cost of this same quart delivered from the farmer to the distributor ranged from 8.7 cents to 10 cents.

The operation of the distributor's plant, including pasteurizing and bottling, ranged from 1 cent to 1.4 cents per quart, and the cost of delivering the milk from the plant to the consumer ranged from 1.61 cents to 3.9 cents per quart. According to the department's figures, the "bottle loss" ranged from one-tenth to two-tenths of a cent per quart. Shrinkage in handling and delivering varied from 2.3 per cent to 5.5 per cent of the total volume.

GUERNSEYS

A May Rose Bull
He Will Suit You

He is Gumption of Koshkonong Place, ready for heavy service and as straight as a line. His sire is Anton's King Cecil, one of the best May Rose bulls in the state. His dam is Gladness of K. P. (414.68 lbs. fat Class G), a daughter of Gilt Edge of K. P. (15 A. R. daughters).

Write me today about him.

MERIDALE JERSEYS

Second Annual Sale
Meredith, Delaware Co., New York
Thursday, June 2nd, 1921

TOM DEMPSEY, *Sale Manager,* Westerville, Ohio

THE day following the annual meeting of the American Jersey Cattle Club in New York.

Unusual care has been exercised in the selection of the cattle offered. Out of some two hundred imported Jerseys now at Meridale Farms, only eighty-two are catalogued for sale; out of forty daughters of Sybil's Gamboge, only sixteen are offered; out of twenty daughters of the Cid, only four are in the sale list.

"The catalogue tells the story." Mailed only on request.

Special sleeping car service from New York City. Reservations must be made in advance by application to us.

2d Annual Guaranty Sale

Oneida Co. Holstein Club

In Combination with Herkimer County Breeders
On the Francis M. Jones Farm, Clinton, N. Y.

June 7-8 — Two Big Days

A sixty-day guaranty sale of selected individuals chosen by an inspection committee appointed by the Club.

A Sale Intended To be Representative Of The Best That Oneida And Herkimer Counties Can Produce

THE ENTIRE A. C. HOWE HERD will be a leading feature. In this extraordinary herd are 18 direct descendants of the 42-lb. cow, Tietje Queen De Kol, including her 30-lb. 2-year-old, Glen Alex Tweede De Kol with the latter's yearling daughter and a last November son sired by Spring Farm King. Glen Alex King Tweede, a full brother to this youngster, has 8 daughters and 3 sons in the herd.

A 2-year-old daughter of Champion Echo Sylvia Pontiac from the 43-lb. 4-year-old, Tietje Queen De Kol 2d, is one of the outstanding entries in this consignment. Her daughter is likewise included and so a last September son of the 43-lb. 4-year-old, sired by Glen Alex King Tweede.

LAST YEAR'S SALE established a high standard of quality. The coming event, it is believed, will be even better. An earnest effort is being put forth to make this a sale that shall be fairly representative of the best that Oneida and Herkimer counties can produce in good Holsteins.

ELECTRIC CARS from Utica will be met at Clinton.

Send for Catalog to

COME TO BISCAY

for your next purchase of pure-bred or grade Holstein cattle, mature or young stock. Large selection, also a few select male calves to offer. Located near station.

BISCAY SALES CO., BISCAY, MINN.

THE MARK OF QUALITY

A Son of Count

Here's your chance to get a son of King Segis Pontiac Count, "the marvel of all sires" for your herd. The daughters of "Count" have exceeded the daughters of all other sires of the breed in both long and short time work.

This young bull is from Buffalo Lois Beets, 7 days 22 lbs. of butter. She is by Buffalo Beets De Kol with 19 A. R. O. daughters, he by Paul Beets De Kol by that famous old Sire De Kol 2nd Paul De Kol with 45 A. R. O. daughters. Her dam Buffalo Lois Johanna 7 days 25.48 lbs. of butter by Johanna Colantha's Lad sire of 26 A. R. O. daughters.

This young bull is for sale at a price that anyone can afford to pay. Write today for his complete pedigree or if you can come and see him. The farm is at Blooming Prairie, Minnesota on the Oak Dale Trail.

Accredited Holstein Sale — Austinburg Ohio June 6th

At the farm of Chas. Whiting, one-half mile north of Austinburg.

55 HEAD COWS AND BRED HEIFERS 55
ALL FROM ACCREDITED HERDS

CHAS. WHITING, AUSTINBURG, BECAUSE of the death of his son, will sell his entire milking herd of 19 cows including Majella Maid Korndyke with 28.20 lbs. butter, 510.9 lbs. milk in 7 days, and her excellent three-year-old daughter, both bred to a 29.46-lb. grandson of King of the Pontiacs. Also several other relatives to this great cow. Only four of these cows have reached mature age, the remainder being 2 to 4 years of age. Also a yearling bull out of the 28.20-lb. cow.

DR. H. O. FREDERICK, ASHTABULA, OHIO, will sell 12 excellent cows and heifers all bred to Daisy Hill Pontiac Fries, a son of King of the Pontiac's son (out of Pauline of Brightview with 1119.91 lbs. butter, 25,606 lbs. milk 365 days) and out of Lady De Kol Fries 2d, who has just made 29.46 lbs. butter 7 days and is on yearly test.

E. D. HUMPHREY & SON, GENEVA, will sell 13 cows and 7 bred heifers. These cows are all 2- and 3-year-olds, all milking and part of them will be bred at sale time. The heifers are all bred for fall freshening.

Besides this excellent lot of cattle, Mr. Whiting will offer for sale his 92-acre farm, all under plow, with good house, excellent barn, steel stanchions for 38 cows, silo and an ideal location for a modern dairy. Every animal from an accredited herd. Every animal guaranteed a breeder. Will accept bankable notes, six to nine months' time at 7%.

Buyers will be met by auto at Hotel Ashtabula, Ashtabula, Ohio.

Under Management of

OHIO HOLSTEIN-FRIESIAN ASS'N, Howard C. Barker, Field Sec., Tiffin, O.

BUY DIRECT

Reasons for Buying Holstein Cattle in Waukesha County:

1. You can buy direct from the breeder through the breeders' association, organized by the breeders to promote the breeding of more and better Holstein cattle and to assist in a fair marketing of the same.
2. There are over 50 pure-bred Holstein sires in service in Waukesha County whose dams have records of over 30 lbs. butter in 7 days or 1,000 lbs. butter in a year.
3. There were 1,307 long-distance tests made on Holsteins in Waukesha County during the past year, which is more than the total in the next four leading counties in the state.
4. There are more tuberculin tested cattle in Waukesha than in any other county in the world.
5. The breeders' organization is in a position to put you in touch with "bred-for-production-stock" at reasonable prices.
6. When buying through the Association, you obtain the services of men who devote their entire time to the Holstein industry. It saves you time. You get more for your money.

BANKER FARMER EXCHANGE
D. H. Otis, Director, 1822 Chadbourne Ave., Madison, Wis.

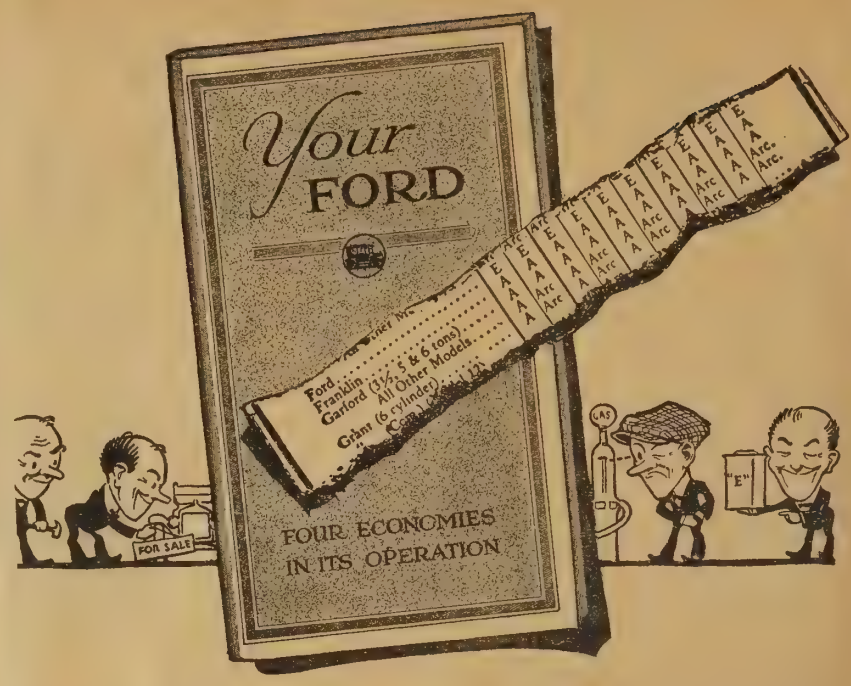
How much does the average cow eat?

The average cow only eats 25 cents worth of grain a day—therefore, the difference in cost between a good ration and a poor ration cannot be more than a *few cents* daily for each cow.

The milk produced by that same cow amounts to about $1.00 per day, and every quart you gain means five or six cents.

Which is the better business—to save three or four cents a day by mixing your own feed—or to use Larro and get one, two, or three more quarts of milk?

Remember—Larro *must* increase your milk yield or you get your money back.



The Larrowe Milling Company

210 Larrowe Bldg. Detroit, Mich.

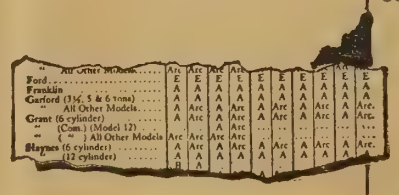
The Ready Ration For Dairy Cows

Send for this Booklet

—no matter how much you already know about your Ford Car or Gargoyle Mobiloil "E"

EVEN after driving for years, some Ford owners are unaware of all the factors which insure—

Economy of Repairs
Economy of Depreciation
Economy of Gasoline
Economy of Oil



The relation of scientific lubrication to these four economies is close. The subject is so important that we cover it in a special booklet—"Your Ford —Four Economies in its Operation."

This Booklet deals thoroughly with the lubricating requirements of the Ford engine. It explains why oil used in a Ford engine should have three definite characteristics. It discusses the eight vital considerations in Ford lubrication. A study of these eight considerations will give you a clearer understanding of the needs of your car—and why Gargoyle Mobiloil "E" scientifically meets each one of them.

The Booklet also contains a cross-section phantom diagram of the Ford engine which will help you to understand better the mechanical problems involved.

You will find this information of permanent value. It belongs with your Ford Instruction Book.

Many of the dealers who sell Gargoyle Mobiloil "E" carry a supply of these Booklets. They will gladly give you a copy. In case your dealer has no spare copies, address our nearest branch.

The Vacuum Oil Company's Chart specifies the grade of Gargoyle Mobiloils for every make and model of car. Gargoyle Mobiloil "E" is the correct grade for Fords. If you drive another make of car send for our Booklet, "Correct Lubrication."

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container.

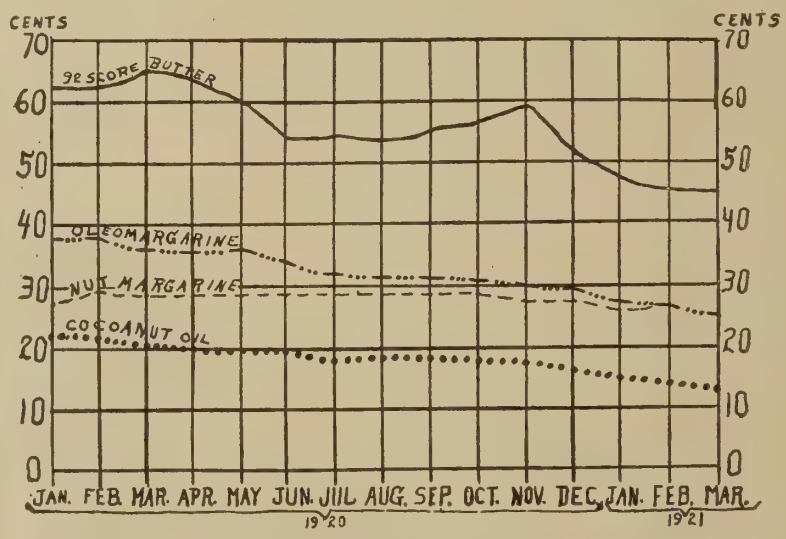
A New Low Price on a Known and Honest Product

Substitutes for Butter and Lard

VEGETABLE oils are used to a larger extent to replace lard than butter according to the U. S. Bureau of Markets. It estimates that lard substitutes comprised 34% of the total lard and lard substitutes produced in the United States, while oleomargarine was about 20% of the total butter and butter substitutes.

It is estimated that there were 1,442,458,000 lbs. of butter produced in the United States during 1920, of which eight hundred million pounds were factory butter and six hundred million pounds were farm butter. The total production of oleo for 1920 was 370,730,000 lbs., of which 191,000,000 lbs. were made exclusively from vegetable oils.

It is estimated that in 1920 the total lard production was 1,936,000,000 lbs. and the substitutes for lard totaled about one billion pounds.



A study of the relative wholesale prices of butter, oleomargarine, nut margarine, and cocoanut oil is shown in the accompanying chart and presents some interesting comparisons. It will be noted that 92 score butter averaged about 20 cents above oleomargarine (the packing house product) and "nut" margarine from cocoanut oil having a spread of about ten cents lower than the packing house product at the beginning of 1920 but reaching the same price at the opening of 1921. Cocoanut oil ranged from slightly above 20 cents a pound to about 12 cents at the end of the fifteen months. Definite figures for April and May are not available as this is written, but the spread between butter and the imitation product is now probably not very large.

"The stability of margarine prices," says the Bureau of Markets, "is probably due in part to controlled production and marketing, while butter prices show the usual fluctuations of commodities whose production and marketing are uncontrolled."

This comparison is more startling when weekly quotations are given, as butter will show changes of as much as ten cents in one month while the imitation product is held at a practically stationary price level.

The total margarine production has increased from 202 million pounds in 1916 to nearly 371 million pounds in 1920, the past year, however, showing a decrease of over a half million pounds from the previous year.

Since 1916 the total production of butter has decreased from 1,621,700,000 lbs. to 1,442,458,000 lbs., or over 179 million lbs.; the decrease from 1919 amounting to over a hundred million pounds. During the past five years the ratio of substitutes to the total butter and substitute has jumped from 10 per cent to 20 per cent.

MAXIMUM MONTHLY WHOLESALE PRICES PER POUND FOR BUTTER, OLEOMARGARINE, NUT MARGARINE, AND COCOANUT OIL AT CHICAGO FOR 15 MONTHS ENDING MARCH 31, 1921

Kansas Dairy Judging Contest

At the Kansas State Agricultural College April 29, one hundred and forty-three students engaged in the largest dairy judging contest ever held in that institution. Eight rings of animals were used in judging, and reasons for placings were given on the cow classes. The contest was under the auspices of the dairy club and was conducted by former dairy judging team members.

Lynn Copeland won first place in the contest, C. W. Clair second, and J. W. Hale third. Mr. Copeland was high man on both Ayrshires and Guernseys, George E. Starkey was high on Holsteins, and Mr. Hale was high on Jerseys.

The Blue Valley Trophy cup to the agricultural association having five representatives in the contest with the highest score was won by the dairy club.

Missouri's Bull Contest

As a result of the $2,000 Better Bull Contest in Missouri, 205 of the state's inferior bulls have already been shipped to the packers and their places taken by registered animals. One hundred and fifteen replacements were made during April.

Many of the pure-bred bulls put into use are secured through sales conducted by county agents and county breeders' associations. At present market prices good breeding animals can be purchased for reasonable prices.

Not only have 205 scrubs been replaced, but 205 farmers have been persuaded of the value of using pure-bred sires. These farmers will purchase pure-bred sires for their other herds and flocks and will improve their methods of animal husbandry in so many ways that the full results of this contest can not be measured merely by the number of scrubs sold, important as that is.

The Six I's of Success

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXI — FORT ATKINSON, WIS., JUNE 3, 1921 — Number 20

Co-operative Creameries—Their Organization and Financing

A. J. McGUIRE, MINNESOTA

THERE are 600 co-operative creameries in Minnesota most of which have been in operation for over 20 years. With but few exceptions they have been successful from the beginning, and they may be offered as proof that a co-operative creamery is a most paying investment for any farming community where dairying is conducted to a reasonable extent.

For comparison we submit the following records: For the year 1920 the average co-operative creamery of Minnesota received 120,000 pounds of butterfat and paid the patrons an average net price for the year of 65.5 cents a pound for butterfat. The highest average for any one month was for March when the average price for butterfat was 74 cents. The best paying co-operative creameries of the state paid an average of 72 cents for the year and 81 as their high point in March (1920). For March, 1921, the best co-operative creameries paid 55 cents a pound for butterfat.

In considering the matter of organizing a co-operative creamery there are certain things that need to be given careful attention, and the first is the amount of cream or butterfat produced in the community. Where there is competition it is not generally advisable to start a co-operative creamery without the assurance of 100,000 lbs. of butterfat a year, or the cream from 700 to 1,000 cows, depending upon their production. A sufficient amount of cream and cream of good quality (sweet) is the very foundation of a successful co-operative creamery.

The First Step

When there is a call for a co-operative, and it seems that there may be cream enough, a meeting should be called and every farmer urged to attend. A man who understands the organization of co-operative creameries should be secured for this meeting. The matter of having a co-operative creamery should be thoroughly discussed and then a vote taken to show whether the majority want to go ahead with the project or not.

If the majority are in favor of a co-operative creamery, a temporary organization may be effected and officers and directors elected. A co-operative creamery constitution and by-laws should be secured for the meeting beforehand. This can be had from the dairy department of an agricultural college.

The first work for the temporary creamery organization is to raise the necessary amount of money for the creamery building and equipment. From $7,000 to $10,000 is required for a plant that will handle the cream from a thousand cows. This will provide for only a modest building, if all the necessary equipment is put in, and proper machinery and equipment is first in importance.

Ten thousand dollars may seem a large sum for a community that has not had a co-operative creamery, but a successful co-operative creamery will easily pay the farmers this amount in two years, over what they would receive without a co-operative creamery. It may be paid in one year or less in a large creamery.

In Minnesota the farmers seldom put more than $3,000 in the first creameries that were built, for both building and equipment, but during the past ten years, $20,000 is a very common amount to be put in a new creamery building for a community and we have a number of creameries that cost from $30,000 to $50,000 and one community expended $100,000 for its new creamery and its equipment. This latter community produces over 400,000 lbs. of butterfat a year and their co-operative creamery has been paying them ten cents more per pound during the past four years than cream stations have paid, so they figure the new creamery paid for itself in less than three years.

FARMERS' CO-OPERATIVE CREAMERY, FERGUS FALLS, MINNESOTA

"The real test of civilization is in the extent to which men can work together, and co-operation points the way to world harmony."

But for the average community producing from 100,000 to 200,000 lbs. of butterfat a year, it is advisable to keep the cost of the creamery within a modest limit. The cost of the creamery need not exceed $10 per cow.

Raising the Money

In starting out to organize a new co-operative creamery association the aim should be, 100 farmers and $100 each. The common way now is to issue shares and we prefer to make them $100. If there are 200 farmers in the community and a ten thousand creamery will do, the shares may be made $50. The creamery pays the going rate of interest on the shares, from six to eight per cent, so that a share in a successful co-operative creamery pays a farmer as well or better than if he had loaned his money through the common channels.

In selling the shares a farmer may be given his choice of three ways of paying for it. He may pay cash, or he may give his note to pay at some future time. All notes taken should be bankable, as it is necessary for the creamery association to borrow money on the notes. When the farmer pays his note he is issued a share. A farmer may also give his note and pay it out of his monthly cream check by having the association deduct five or ten per cent from each cream check. It is well to have the entire cost of the creamery provided for either in cash or individual notes. In other words, it is not well for a few farmers to buy shares and also assume the debt of the creamery, while most of the farmers of the community stand back to see if the creamery will be a success before they come in. Every farmer should assume his share of the responsibility from the beginning, and if the great majority of farmers of a community are not willing to do this it is evidence that a co-operative creamery would not be a success.

In soliciting shares it should be specifically stated in the agreement that if a certain number of shares are not sold, the creamery shall not be built. The farmers who are willing to buy shares on the start should be assured that they will not have to carry the whole load. The agreement may read thus: I hereby agree to buy a share of stock at $100. If 70 shares are not sold at $100 each, this agreement shall become null and void.

In the early years in Minnesota a number of creameries were built without shares. The farmers simply went together and signed a joint note or gave their individual notes to the bank and borrowed the amount of money necessary to build and equip the creamery. A sinking fund was established by deducting a certain number of cents from each 100 lbs. of milk or from each pound of butterfat. This went to pay off the note or notes at the bank and when the entire payment was made the note or notes were handed back and the creamery belonged to the community A few of the creameries still operate under this plan.

When the necessary funds are provided for either through the sale of shares or security notes, another meeting is called and the association made a permanent one. The constitution and by-laws are adopted and arrangements made for the plans and building of the creamery. The selection of a creamery site is important. In the early years the creamery was generally located on the outskirts of the town. Now the best lot in town is selected. A co-operative creamery association recently organized in Minnesota has selected a site that is valued at $8,000. It happens to be in a good sized town where real estate is valuable, but they realize that to have a convenient and suitable location for the creamery in town is also valuable.

The state dairy department should be consulted in regard to plans for the creamery building or a successful creamery architect. It is extremely important to build the creamery according to proper plans and specifications.

Creamery Management

We may say most emphatically that co-operation pays and prove it, but there is no magic in co-operation. It must be conducted on good sound business principles and its success depends upon able business management as much as any business in the world. It will not run itself and it will not command respect and confidence only through good work on the part of the men who are responsible for its management. For this reason the ablest man in the community should be elected to the office of secretary-manager and a first class creamery operator employed.

The Patron's Duty

When the farmers have elected their creamery officers and paid over their money, their duty does not end with this. They must at all times see that the cream they take to the creamery is in such condition that it can be made into butter that will sell for the highest market price. In addition to this they must keep an active interest in the management of the creamery and, if things are not going right, they should meet with the creamery board and try to help make the business go right. There is one thing a patron of the creamery should never do and that is to quit. He may find fault and criticize (though he should do this to the creamery board), he may take off his coat and fight if he thinks it necessary (but it never is necessary), but the one unforgivable thing is to quit. We would still be living in caves and making our wants known in grunts and cries, if men always quit when things went wrong.

The real test of civilization is in the extent to which men can work together, and co-operation points the way to world harmony.

PRESIDENTIAL ADDRESS OF D. D. AITKEN

Excerpts from the Remarks of the Chairman at the Annual Meeting of the Holstein-Friesian Association of America at Syracuse, New York, June 1st

WE meet again in the Empire State. While we appreciated our size and felt we were quite an institution when we last met in New York six years ago, at that time we were in reality but an infant as compared to the present. In a short span of six years the membership of this association has practically tripled, and it has expanded more rapidly in influence than in

D. D. AITKEN

number. When we appreciate what that indicates for the future we can have a faint realization of the responsibilities that rest upon the management of this association.

The Holstein-Friesian Association of America stands today as an evidence of what good will and true merit will build under reasonable direction. The success of the Holstein-Association is the merit of the animals it represents, and it is the wonderful merit of the black and white cow that made it possible for the Holstein-Friesian Association to become the greatest pure-bred live stock breeders' association on the face of the earth.

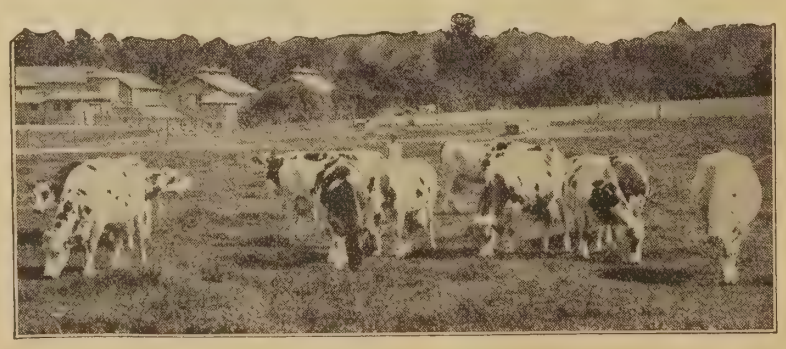
While New England has just claim to the title of "Cradle of the Holstein-Friesian Breed", New York State may fairly be termed the "Nursery of the Breed", as its early development was assuredly aided in the Empire State. It has had a most eventful career here which has carried it to its greatest numerical strength in both cattle and breeders within the borders of New York. New York has 3,300 owners of Holsteins and more Holstein cattle than any other territorial division of her size on the North American continent.

Membership

The best interests of the association demand that every person interested in the breeding and ownership of these cattle should at once become a life member. The annual growth of the membership list is splendid testimony of the recognition of its benefits, but a still greater percentage of Holstein owners should avail themselves of members' privileges and the many advantages thereof. No member has done his full duty to the association who refrains from earnest and continued effort to convince his non-member neighbor of its advantages. In the past year a total of 2,182 new members has been added to our roll, after most careful investigation of their fitness through various agencies and through local and state Holstein organizations.

Half a Century of Service

Fifty years of organized effort in Holstein activities closed with March, 1921. During its fifty years of life this association has recorded the pedigrees of 965,041 animals, including those of the Dutch-Friesian and the Western Holstein Herd Books.



The past evidences good management and prosperity, widespread interest in and use of the Holstein-Friesian; the future contains no lack of promise. We are now recording the pedigrees of 127,850 cattle per year with an annual average increase of ten per cent.

The Advanced Registry contains milk and butter records to the number of 125,000 and last year there were added thereto about 17,000 records. These records constitute a demonstration of the productive capacity both in number and in size unequalled and unapproachable in the history of the dairy world. The number of yearly records made last year was 8,750, and is the most interesting feature of A. R. O. work of today.

Extension Service

Under this heading is carried on most of the activities of the association aside from the registration and transfer of animals, and the Advanced Registry office. It has become that portion of our effort on which has been directed every practical thought for developing in the minds of American citizens a better knowledge of Holstein-Friesian cattle.

Interest in any industry, interest in any breed of live stock, can only be maintained and continued on its merits. You may by striking advertisements sell your first article, but if you have to depend upon your advertising alone to sell all future articles your industry will fail; you must have intrinsic value in the article itself if you hope to win over a long

period of time. However, no matter how good your article is you must first present its quality to the users or consumers, and I know of no industry under the sun that has so much merit as this black and white milking machine. She produces the most essential food, she produces at a lower cost than any other food of like merit can be produced, and wherever she has been introduced and used by experienced operators she has never failed to meet the expectation of her owner.

Exportation of Cattle

The association has continued its service in aiding inquirers from foreign countries to locate registered Holsteins and in assisting breeders to make sales for export. Upon receipt of an inquiry the practice is, after translation of the correspondence, to place the details of the inquiry in the hands of the various club secretaries, who in turn advise their members of the opportunity. The sale may or may not be consummated directly by the American breeder but information as to details of shipping, health examination, and certificates, and of the Herd Book requirements of the country of export are supplied by the secretary's office as desired.

Advanced Registry

Advanced Registry, next to registration, to my mind is the most important division of our industry. The registration tabulates and preserves the blood lines and maintains the purity of the breed without which no continued improvement would be possible. The Advanced Registry office makes possible the measure of production and tabulates the results achieved. In these two departments we can maintain the purity of the blood lines of the black and whites, and in the other we can demonstrate to a moral certainty her superiority as a producer and, after all, the demonstration of that superiority is just as essential as the maintenance of the blood lines, because without proof of superiority we would be unable to accomplish anything.

I believe that our Advanced Registry has done more to promote the interests of the black and white cow than all other causes combined, for the simple reason that it is proof of what she can accomplish, and that is what fixes the value in the public mind.

One of the things that the Holstein-Friesian Association must realize is that it is not just enough to record the breeding of an animal. If that were all there was to it there would not be very many that would take the trouble to have their animals recorded. They want them recorded because of their capacity and ability to produce milk. The past has shown that they can produce more milk and butterfat than any other breed of cows, and the way we get evidence of this is from the Advanced Registry office. To my notion the Advanced Registry office is simply a part of the expense of registration.

Prizes at Fairs

The Holstein-Friesian Association has, until very recent years, given most of its prizes for production rather than type, expending very much more money for prizes through the Advanced Registry office than for premiums at fairs. In recent years, however, as type has become more and more recognized and the feeling has grown that type is predicated on probable production, the association has gradually been increasing premiums at fairs, adding percentages to state and district fair awards until in the present year our awards at state and district fairs on type will nearly equal the prizes paid for butterfat production and, in my judgment, both of these prizes will have to be increased.

As I have been saying each year since becoming president of the Holstein-Friesian Association, the maintenance of type in our breeding and in the estimation of the purchasing public is absolutely essential for the perpetuity and welfare of the Holstein-Friesian industry. At the present time, as shown by many auctions, type represents at the sales of averaged priced animals 60%; in other words, an animal will sell for 60% more if it is of good type than it will if it is of inferior type, and this of itself should be sufficient incentive to induce us to recognize the necessity of stimulating interest in the type of our animals.

Holstein-Friesian Census

A census of the Holstein-Friesian cattle was taken as of August 1, 1919, and demonstrated the absolute necessity of tabulating Holstein-Friesian registered cattle if we ever expect to know what is essential for us to know if we hope to reap the best results.

At the time the census was taken I talked with a great many persons who had opportunity to form opinions about the number of Holstein-Friesian cows there were in milk in the United States, and their estimates varied all the way from 250,000 to 500,000, while I was satisfied myself that there were less than 150,000 registered Holstein-Friesian milk cows in the United States at that time.

The result of the census shows that there was probably less than 150,000 Holstein-Friesian cows in milk August 1, 1919, and it gives people a better idea of how few pure-bred Holstein-Friesian cows there were in comparison with the 24,000,000 milk cows in the United States. I doubt if we have ever done anything that so stimulated interest in the breed as did this census. It not only was a great benefit to the Holstein-Friesian breed but was a great benefit to all breeders of pure-bred live stock.

I think it will be one of the greatest mistakes we ever make if we do not establish a system of census taking at very short intervals. I believe we should take another census on the first of August, 1921.

National Dairy Council

The work of the National Dairy Council is without question the most important work that is being done in America in the interest of dairy husbandry. More people have heard about milk as a food, about the food value of butter, cream, cheese, and cottage cheese, through the National Dairy Council than probably through all other means combined during the last year, not perhaps directly because of what has been published or said by the National Dairy Council but because of the promotion work the Council is in. Constantly campaigns are being propelled, as it were, by the National Dairy Council, all over the country. Millions of pamphlets have been printed by the National Dairy Council and furnished to campaign committees all over the United States, and in my judgment the activities of the National Dairy Council have done more to study and keep up a reasonable demand for milk during the depression under which we are now la-

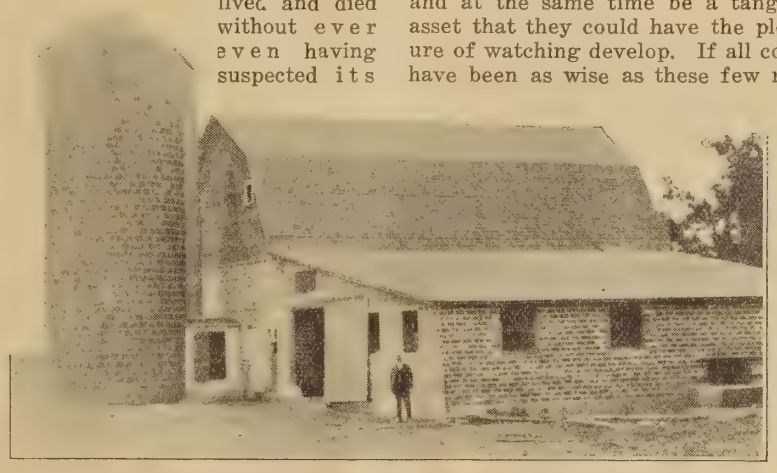
OIL WELLS VS. MILK WELLS

C. M. LONG, MISSOURI

C. M. LONG

His activities in "promoting milk wells" in Pettis County have been of great profit to the farmers of that section. So successful has he been that the Illinois Holstein Breeders' Association has sought his help in improving Holstein conditions throughout the state. Announcement is recently made that he has accepted the position of secretary for the association, assuming his new duties June 1.

Mr. Long's "milk well promotion", which he outlined in Hoard's Dairyman in October, 1917, was conducted by a company of leading farmers and other business men capitalized for $30,000 in the Pettis County Holstein-Friesian Company. This company purchased Holsteins at that time and placed them in the keeping of farmer stockholders in the company. The cattle were owned and registered in the name of the company. The farmer agreed to keep the cows and their female offspring for five years, put them in a testing association, and test his herd for tuberculosis annually. Breeding and veterinary fees are divided. The company pays for A. R. testing and provides highly bred bulls. The farmer gets the milk. Bull calves are sold in an annual auction and female offspring at the end of five years and the proceeds divided. The sale price of the original cattle goes back to the company.



IF a "gusher" should break forth on your farm I know you would be wild with excitement. Your whole community would be almost as badly excited. In fact, the whole county would be in a turmoil. People, good, bad, and indifferent, would rush in, land would soar in price. What community would not wish for such great good fortune?

Let me say to you after much meditation that if you have a good agricultural community this would be about the most unfortunate thing that could happen to it. Let us draw a picture of what the results would be. A few people would make a great deal of money. They would move to New York or Chicago to spend it. The rank and file would eke out a mere existence. The morale and the morals of your peaceful community would be gone. In a few years, maybe ten, maybe fifty, but some day in a comparatively short time, the last drop of oil will have been pumped out of the last well. The people will leave like rats from a sinking ship. The countryside will be dotted with unsightly derricks and miserable shacks. From these shacks will come thin, sad faced, anemic children—not the kind that our citizenry is made of. Your agriculture will be gone and your county, like a squeezed lemon, will be thrown on the garbage heap.

Suppose, instead of discovering oil, your community discovers milk. No one will become very rich but all will be prosperous and contented. Your land will be beautiful with waving corn and sweet smelling clover and alfalfa. Instead of derricks, silos and windmills will rear their heads; instead of shacks, red barns and beautiful homes will beautify the landscape. Homes that will send forth red-cheeked, happy children are the future hope of America for they are the kind that never wave a red flag. Instead of the land becoming useless it will become more and more fertile until in ten, twenty, or fifty years it will have become so fertile it can support a population almost like a city. Generation after generation can come forth and be proud of their heritage and hand it on to their children, enhanced in value and usefulness.

I am reciting neither idle fancy nor prophecy but actual history. Go with me to Indiana, Oklahoma, or Texas and I will show you the one picture. Go with me to Wisconsin and I will show you the other. If you had a magic wand, which would you choose for your community?

I am not mindful of the necessity and great value of oil. I realize that the world's commerce would be greatly retarded without it. However, I would call your attention to the fact that many thousands of people have lived and died without ever even having suspected its existence. No people have ever lived without milk. The last drop of oil could go up in smoke tomorrow and we would continue to live. If the last source of milk should be eliminated the human race would disappear from the earth in one generation. Therefore, I say that the milk wells of the good old black and white cow are of more importance than all the oil wells of the world. I sincerely hope that the wells now in existence will continue to bring forth such an abundance that it will never be necessary to despoil any more good agricultural communities.

MODERN DAIRY BARN OWNED BY W. E. FILES AND ERECTED BECAUSE OF THE RESULTS OF THE COMPANY'S WORK WITH HOLSTEINS

Instead of feeding market cattle as he formerly did and meeting the losses of recent times, Mr. Files nets a comfortable profit from his Holsteins.

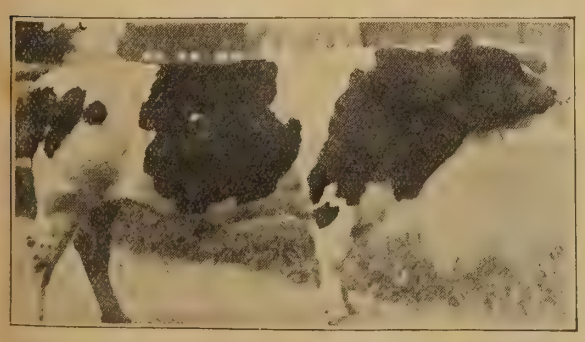
It was with such a vision of what the dairy cow means to a community that we deliberately set about in 1917 to induce the farmers of Pettis County, Missouri, to develop milk.

The story of how the business men and farmers put their money together and started this development has been told too often to need repetition here. You are interested only in the results obtained. For years and years both business men and farmers had been taking occasional "fliers" in oil and mines. Generally the "unexpected" had happened and the investor was left far poorer and apparently not much wiser. In one year a single individual induced the people of Pettis County to "invest" in oil to the extent of a quarter of a million dollars. Individuals put in as much as thirty thousand dollars. It's all gone. Our corporation gave them an opportunity to invest in something that would develop their own community and at the same time be a tangible asset that they could have the pleasure of watching develop. If all could have been as wise as these few men and the entire quarter of a million dollars had been invested in various kinds of live stock, in an organized way, we would now have the most wonderful live stock county in America, and what is more these investors would still have their money.

One thing we said to the farmers when we asked them to lease these cows was that they would produce more profit than the cows that they owned. The last cow tester's report on these cows showed that we told the truth for the pure-bred cows our company placed on their farms produced thirty-five per cent more profit above feed cost than the farmer's cows on whose farms they were kept.

We said, "You will be better farmers if you will handle pure-bred cattle." Nine men out of twenty-five who have these cattle have either built new barns or remodeled their old barns since our corporation brought in these cows. Four have built silos. Two have bought milking machines. Very few had alfalfa. Now all but two or three have it and they are growing soy beans or other legumes until they can arrange for it.

We said, "It will make better dairymen out of our farmers." There had never been a cow testing association in Pettis County previous to 1917, when these cows were put in. There has been one in continuous operation since except for a short time during the war when no tester could be had. There had never been an A. R. O. record made in the county. In the last two years more than fifty cows kept by about twenty different farmers have made records. Two farmers are now doing semi-official testing. Men in the county now hold third place in the state record for milk production in the full aged class and third place in butter production, also fifth place in butter production in this class. They hold fourth place in butter production in the senior four-year-old class, second place in the senior three-year-old class, and fifth place in the junior two-year-old class. There is a friendly rivalry between breeders to see who can maintain the high cow.



While only two farmers had pure-breds before our company began operation now nine men own pure-breds.

We said to the Chamber of Commerce and the Farm Bureau, "This will make your county the recognized center for pure-bred Holsteins in Missouri." No less an authority than Professor Eckles formerly of Missouri Agricultural College says that we are now so recognized. Letters have come from practically every state in the Union asking about the plan. Many committees have visited us to inspect the organization. Five communities have adopted this plan.

We said, "It will make the farmers more prosperous." Our cow testing records show that last year our dairymen got on the average $1.96 for each hundred pounds of feed given to the dairy cow.

We said to the men whom we were trying to get to invest in the company, "You will not only improve the agricultural conditions of your county but you will make a return of at least eighty per cent on your investment during the five years." When three years had elapsed our inventory showed that our $35,000-investment had grown to $56,000. It will increase much more rapidly the last two years. This plan has created a most friendly feeling between the farmers and the city men. The latter are very much interested in Holsteins and read everything they can get about them.

Some day they will realize that the discovery of milk is more important than the discovery of oil.

One of the three herd sires owned by the Pettis County Holstein-Friesian Co. of Missouri.

TWO "COMPANY" COWS WHICH MADE RECORDS OF 17 LBS. AND 23 LBS. FOR A MEMBER IN HIS FIRST TESTING

Peas in the Dairy Ration

ORIN CROOKER, ILLINOIS

PEA growing for factory purposes is common in many dairy districts. Fortunately, the by-products of the pea industry find a valuable place in dairy feeding and farmers who have a "patch of peas" are coming to see that peas and cows go well together. None of the pea crop is used commercially, of course, except the seed in its green state. It is harvested at a time when the vines contain a maximum amount of nutrients and when in prime condition, also, to be turned either into succulent feed or into hay.

Three methods are followed in utilizing pea vines after they have come through the viner. One is to return them to the farm and stack them in the close vicinity of the dairy stable. After the stack has stood a short time it begins to exude a gummy substance which operates to seal the stack and prevents rapid deterioration of its contents. From 6 to 12 inches of the surface vines must be discarded in feeding but the rest will be found in good condition. It constitutes a splendid addition to the dairy ration as it possesses a sweet aroma which the cows seem to enjoy. Stack fed cows have been known to show a reduction in milk when changed to corn silage. Consequently, some dairymen use the stack vines and corn silage on alternate days. This makes the pea vines go further and keeps up the milk flow.

The use of pea vines for silage is also a common practice and where one is so fortunate as to have a viner stationed on the farm by the canning company it is often possible to run the vines directly into the silo without the rehandling that is needed if this is not the case. Pea silage is somewhat rank and strong and cows will not eat so much of it as they will of corn silage. Consequently, some dairymen feel that it is more profitable to use the vines in the form of hay. As such it is about on a par with clover in the feeding ration. Hay from late peas is of better feeding value than from the early crop for the reason that the vines are larger, greener, and carry more food nutrients. It must be cured by spreading on the fields where it is turned once or twice to facilitate drying. Men who have used pea vines in one form or another for dairy feeding figure that they are worth from $12 to $14 an acre. When this is added to the income from the pea crop itself, it usually shows a most substantial return for the expense and labor involved in growing a few acres.

PEAVINES FOR SILAGE—A VINER ON THE FARM PERMITS RUNNING THE VINES DIRECTLY INTO THE SILO WITHOUT REHANDLING

Community Breeders' Clubs

W. A. DUFFY, WISCONSIN

THE organization of breeders devoted to a particular breed of cattle into a county association has advanced the dairy interest of Wisconsin, as has no other one factor. By this form of co-operation advertising is carried on, sales are held, and the knowledge of the business spread among the membership. In looking for the prominent cattle breeders of a county a glance at the membership list of the county association will generally give them. However, the fault of the old form of county association lies in this very fact: The prominent breeders are members and the rest of the dairymen of the county are not. The association must necessarily function for its members. Though there may be scraps of good in a general way to be gained by all breeders the tendency is for the average dairyman to stand and look on, or perhaps to find fault because "Mr. Blank", prominent breeder, has gained certain advantages through the county association. The foregoing facts are all well known to men who have given consideration to the subject. The solution of the problem, however, was that someone propose a plan in which every dairyman with a particular breed might work as a part of the organized group and which would in general promise better results than the old.

Professor E. L. Luther, superintendent of farmers' institutes, has given careful consideration to this problem and to him we are indebted for the plan of the Community Breeders' Club, organized into the county association.

The Community Breeders' Club has its own complete organization including a written constitution. Every breeder in the community is eligible to membership provided he agrees to breed to a pure-bred sire of the particular breed of the club. Two officers only are elected, a president and a secretary-treasurer. The two officers of each club represent the club on the executive board of the county association. The dues of each member of a local club are divided, part being paid into the treasury of the county association. This plan automatically makes each member of a club also a member of the county association. The business of the county association, however, is conducted by the executive board composed of the officers of the various clubs. The executive board of the county association elects the officers.

Below is given Professor Luther's plan including the constitution adopted by the local clubs and the scheme endorsed for organizing the executive board of the Barron County Holstein Breeders' Association which reorganized adopting the new plan:

Constitution of Community Club

Article I—The name of this community association shall be the .....

Article II—The object of this community association shall be to promote the breeding and improvement of high grade and pure-bred Holstein cattle in Barron County and to aid its members in buying, using, and selling first-class animals.

Article III—The annual membership shall consist of farmers interested in the object of this association and paying the required annual fee.

Article IV—The officers shall be a president and a secretary-treasurer. In case of the absence of either or both of these officers from any meeting the club will choose officers pro tem.

Article V—Meetings of this club will be held at the call of the president.

Article VI—The election of officers shall be held annually at a meeting of which each member has been notified in writing. The election shall be by ballot.

Article VII—It is understood that in case other communities of Barron County shall organize Holstein Clubs on the basis of this club the two officers of this club shall become representatives of their club on the board of directors of the Barron County Holstein Breeders' Association.

Article VIII—Amendments to this constitution may be made by a two-thirds majority vote of the members present at a regularly called meeting.

By-Laws of Community Club

Section 1—Any person upon the recommendation of a member and the vote of the club shall become a member upon paying the secretary-treasurer the annual fee.

Section 2—It shall be the duty of every member to improve his herd of cattle by mating his cows exclusively with pure-bred bulls of the Holstein breed and doing as much as he can to care for his herd in an up-to-date manner.

It shall also be the duty of the members of this club to co-operate as far as possible with their fellow-members in the use of pure-bred bulls and in buying and selling animals; also to get new members and encourage them in the practice of better methods in caring for their herds.

All members in good standing shall be entitled to vote at all meetings of this club.

Section 3—The membership dues shall be $2.00 payable annually to the secretary-treasurer of the club; one-half to be retained in the treasury of the local club and the balance to be paid into the treasury of the county association.

Section 4—A member in arrears over one year shall cease to be a member but may be restored by paying all arrears.

Section 5—The officers shall be elected to serve one year and shall perform such services as are ordinarily required by similar positions.

Section 6—At each annual meeting there shall be appointed an auditing committee of three, whose duty it shall be to examine and report upon all books and accounts of the officers for the year.

Section 7—1. Call to order; 2. Reading of minutes of previous meeting; 3. Report of treasurer; 4. Report of Committees; 5. Unfinished business; 6. New business; 7. Adjournment.

Section 8—The meetings of this club shall be governed by Robert's Rules of Order.

County Organization Plan

The members of the ..... club in meeting assembled endorse the following rules for organizing and governing a county executive board which shall federate the interests of this club with those of similar clubs organized for promoting the development of Holstein cattle in Barron County. This county executive board is to constitute the executive board of the Barron County Holstein Breeders' Association.

Rule 1—The president and secretary-treasurer of each community club of the Holstein breed in Barron County shall become members of the executive board of the Barron County Holstein Breeders' Association.

Rule 2—Upon a call designating the place and time of meeting, signed by at least three presidents of community clubs of the Holstein breed in Barron County, the officers of the various community clubs of the Holstein breed will meet and organize the county executive board.

Rule 3—The executive board shall elect by ballot a president, a vice-president, a secretary, and a treasurer, who shall hold office for one year.

Rule 4—The duties of the officers of the Barron County Holstein Breeders' Association shall be such as are commonly performed by officers of similar organizations. The president shall preside at the meetings of the executive board and the secretary shall keep a record of the meetings of the executive board and receive all moneys paid to the county association and turn them over to the treasurer. The treasurer shall pay out moneys only on the written warrant of the president and secretary. The officers of the executive board shall constitute the executive committee of the Barron County Holstein Breeders' Association.

Rule 5—There shall be at least one annual meeting of the executive board for the transaction of business and the election of officers and such other meetings as the president may call upon the written request of three members of the executive board.

Rule 6—The executive board shall consider the county-wide interests of the Holstein breed, plan for the organization of new committees and strengthening weak communities, suggest lines of work for all community associations, organize county and community sales and show herds and do such other things as shall advance the interests of the Barron County Holstein Breeders' Association.

Rule 7—The Executive Board shall determine a uniform membership fee for the various community clubs and a per capita tax for the support of the work of the Barron County Holstein Breeders' Association.

Rule 8—These rules may be amended by a

Association Notes

Oostburg, Wisconsin:—Two reactors were disposed of. Most all members are feeding balanced rations and getting splendid results. Two pure-bred bulls were purchased. During April, market milk testing 3.6 per cent sold for $2.15 per cwt. Milk retailed for 12c per quart. Feed sold as follows: Bran, $27 per ton; oats, $31; corn meal, $24; oil meal, $44; cottonseed meal, $45; gluten, $42; silage, $6; mixed hay, $16.

Fairfax County No. 1, Virginia:—Four unprofitable cows were sold during the month. An example of increased production due to better feeding is well illustrated this month. An owner engaged a new herdsman. Last month 15 cows, fresh from 2 to 4 weeks, were tested with an average milk production of 1,281 lbs. per cow. This month under the care of the new herdsman, the same 15 cows with 5 fresh heifers averaged 1,343 lbs. of milk. The original 15 cows averaged from 2 to 8 lbs. of milk per day more than last month. Market milk testing 3.5 per cent sold for $4.19 per cwt. and 36c per gallon. Milk retailed for 16c per quart. Larro sold for $54 per ton; Unicorn, $52; linseed meal, $52; cottonseed meal, $42; bran, $45; silage, $10; alfalfa, $30; clover and timothy hay, $25.

Webster County, Missouri:—The creamery paid 35c per pound for fat during April. Feed prices: cottonseed meal, $36 per ton; bran, $26; corn and cob meal, $26; hay, $15; silage, $6; pasture, $1.50 per head per month.

Ada County, Idaho:—Boise Valley in general is gradually turning to pure-bred dairy cows. Market milk testing 4 per cent sold for $1.90 per cwt. The condensery paid $1.90 per pound for fat and in addition $2.70 per 100 lbs. milk. The creamery paid 32c per pound for fat. Milk retailed for 12c per quart, butter for 22½c per pound, and cheese 22c. Barley sold for $1.50 per cwt.; corn, $1.95; oats, $2.35; oil meal, $4.50; mill feed, $1.60; alfalfa hay, $10 per ton.

Stillaquamish, Washington:—During April 3.6 per cent milk sold for $2.75 per cwt. Five cents were paid for each point above. The condensery paid $2.35 per cwt. for 3.8 per cent milk. The creamery paid 43c per pound for fat. Milk retailed for 11c per quart and butter for 47c per pound. Ground oats sold for $40 per ton; molasses feed, $50; dairy feed, $46; millrun, $34; oil meal, $76; soy beans, $57: corn meal, $45; alfalfa meal, $35; alfalfa hay, $23; local hay, $18; silage, $9; roots, $6.

Southern York County, Pennsylvania:—Fifteen men are using pure-bred sires and three have all pure-breds, while seven others have started pure-bred herds. Six members are now using balanced rations and an effort is being made through the association to have every member use a balanced ration as a means of economical milk production. An effort is being made to have every member use a pure-bred sire.

Canton, Pennsylvania:—Jersey, a cow belonging to Herbert Wilcox, freshened in November, 1918. As she was past 15 years of age, her owner slated her for the market as soon as her milk production dropped below the point of profit. On May 7, "Jersey" gave 22 lbs. of 5.3 per cent milk. During April market milk sold for $2.00 per cwt. The creamery paid 52c per pound for fat. Milk retailed for 11c per quart and butter for 49c per pound. Cottonseed meal cost $40 per ton; oil meal, $50; gluten, $40; wheat bran, $33; corn meal, $33; hominy, $36; ground oats, $37.

Western Shawano Co. Breeders' Association:—This association sold ten head of grade Holsteins to an outside buyer. It will consign several head to the Holstein sale in June. Market milk sold for $1.35 per cwt. during April.

Laurel Hill, Pennsylvania:—Nine unprofitable cows were sold. Two pure-bred bulls were bought. Market milk testing 3 per cent sold for $2.10 per cwt. Four cents were paid for each point above. The creamery paid 56.8c per pound for fat. Wheat bran sold for $36 per ton; gluten, $47; ground oats, $42; corn meal, $36; oil meal, $54; cottonseed meal, $47; buckwheat shorts, $44.

Du Page County, Illinois:—Six undesirable cows were sold. Five members purchased pure-bred bulls at the state Holstein sale and eight other bulls were purchased by farmers in this county. One member purchased two pure-bred cows at the sale and another purchased the cow that topped the sale. The bull that topped the sale was secured by another member. Market milk sold for $2.35 per cwt. during the month of April. Milk retailed for 14c per quart. Silage sold for $6 per ton; hay, $25; oats, $26; corn, $23; barley, $32; bran, $28; cottonseed meal, $38; oil meal, $46; gluten, $37.

Cumberland County, Pennsylvania:

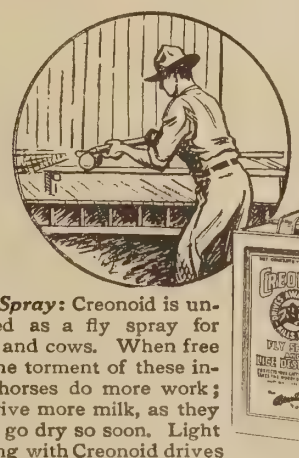
In spraying cattle or horses, the nozzle of sprayer should be held four feet from the animals.



A Barrett Product

CREONOID is a scientific preparation which has been used for years by thousands of progressive farmers all over the United States and Canada.

CREONOID

FLY SPRAY AND LICE DESTROYER

IT is a *Barrett Product.* And behind the Barrett trade mark stands the reputation of one of America's oldest and largest manufacturers of coal tar specialties. You can depend upon Creonoid to do all we claim for it—and more.

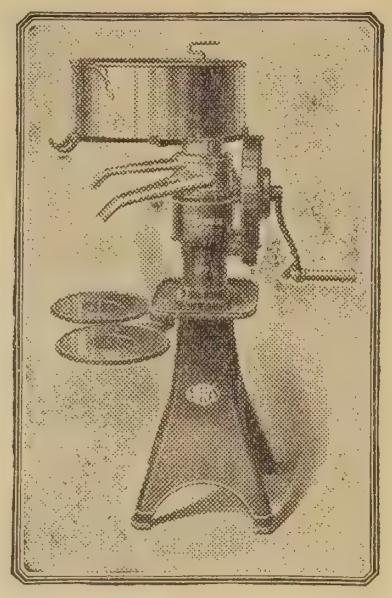
It comes all ready for use. Is inexpensive, easy to apply and wonderfully effective. It pays for itself many times over in better animal health and increased milk, egg and pork production.

Creonoid is safe, and does not gum the hair.

Fly Spray: Creonoid is unequalled as a fly spray for horses and cows. When free from the torment of these insects, horses do more work; cows give more milk, as they do not go dry so soon. Light spraying with Creonoid drives the flies away *and keeps them away.*

For Chicken Mites: If your hens are droopy, unhealthy and laying poorly, it's a pretty good sign the chicken house is infested with mites. Creonoid will drive away this pest and you'll be surprised at the improved appearance of your hens and the increased number of eggs they lay.

For Hog Lice: Lice keep hogs from fattening. They suck the blood and keep the animals busy at the rubbing post. Creonoid is a sure relief from the torment of these vermin. It means more pounds per hog and more profits.



Creonoid is put up in 1 and 5 gallon cans and in 50 gallon barrels. If your dealer can't supply you, write us.

Write for free illustrated booklet, describing uses and methods of application.

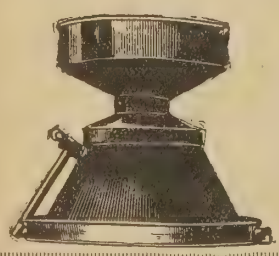
Primrose Prices Reduced
See Your International Dealer!



IN the unequalled success of American dairying the Primrose Cream Separator has played a prominent and deserving part. The Primrose is today the highly perfected result of many years' improvement and betterment. In design and workmanship it is a quality product entirely worthy of the 90-year manufacturing record of the Harvester Company. *With the present price reductions,* Primrose will help more and more farmers to a realization of maximum profit.

Dairying yields the utmost in final results when a Primrose Cream Separator handles the milk. The efficient record of tens of thousands of Primroses in the hands of individual owners makes that statement authoritative. Study the Primrose and take advantage of Primrose lower price at the stores of the International dealers.

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

A VISIT TO UTICA

H. H LYON, NEW YORK

I WISH it were possible for every timid dairyman who has signed the pooling contract, and all others for that matter in League territory, to get into the new League headquarters at Utica and stay long enough to look the situation over very carefully. Then I wish he might sit for a few hours in the assembly room where district managers are "going to school" and get a clear insight into the details that have been worked out for handling the co-operative proposition. The League management is scarcely liable to be taken by surprise at any turn for they have gone to the bottom of things in a way that is really surprising. I do not mean by this that there are to be no difficulties to encounter for that is inevitable, but careful forethought has been exercised to a remarkable degree.

Those in touch with affairs generally, on the farms of this region, know that nearly all of the League offices have been moved from New York City to Utica. Rent is vastly cheaper and employees can be had at much less cost. With the present expansion much more room is required and had this been taken in the metropolitan city costs would have been staggering. Just now something like a hundred and fifty employees are at work, but when the dealers commence to send in their sheets of figures, giving names of patrons and amounts of milk, tests and classes of disposition of products, as is to happen on or before June 6th, and various other information up to the 10th, there will need to be many more employed. Indeed, additional room in the building is being taken now.

The Childs building, four stories high, is now occupied entire. At the risk of being called an "old farmer" I went out and paced it off. If it is much under 50x100 feet then I must have been embarrassed by spectators while pacing. Our older farmers of this section of the state will remember when very much of our farming machinery came from Utica and when Childs did the distributing.

They say that farmers are in charge of this League co-operative business. I hope so. All the same when you get hold of the sheets that show, when filled out, every detail of purchase, sale, and disposition of milk, machinery, supplies, salaries, and incidental expenses you find it was no amateur piece of work. The writer once considered that he knew quite a lot about the complicated systems of bookkeeping once taught in our business schools. The more complicated and exacting they were the more fun it was to see students puzzle over them. Complicated systems now hold no particular attraction but exact checking does. That is why I was particularly interested in the systems that are to go into effect, indeed are in effect at this moment. While exact booking may be somewhat remote from my interests of late years, I still think I know a good system when I see it.

Mr. Weiant of the Newark League office, who has devised systems for the milk business ere this, was in Utica for some time. He did not say he had any hand in working this one out, but when questions of difficulty came up the working was clear to him. "We have got everything in excellent shape," he explained to me. "It is perfectly easy and simple and looks big only because there are many men and a large quantity to be handled. It is no more difficult than a small business only it takes more individuals to do the work."

Mr. Eastman, editor of the League News, introduced me to the comptroller, H. C. Crombie, and suggested that he explain how simple it is going to be to take the dealer's figures and prices and determine just how much money he should pay, using three per cent milk as the basis. The fat differentials will be the same both from the dealer and to the farmer. Reducing or advancing the dealer's price to the pooling price will be simple, then add the fat differentials and you have it. I confess that I had to go over that in my mind a number of times before I really saw it, but Mr. Crombie rattled it off in almost no time. He did it clearly, too. True, he is considered one of the best expert accountants in the state. Then there are other expert accountants and I heard twenty men question them by the hour in order to get complete details and they didn't get "rattled", and seldom hesitated. Don't fear for the accounting system. It will work.

As I understand the arrangement, there are to be twenty-four district managers. These appear to be generally farmers with considerable experience in meeting men both at the farm and in meetings held. Difficulties of varied description are certain to come up in all localities. These will be as to tests, weights, payments, re-

RYANBE BURKE, HOLSTEIN COW OWNED BY R. E. BENSON, WISCONSIN

In 305 days she produced as a three-year-old 19,314.8 lbs. milk containing 645.2 lbs. fat. Freshening again as a four-year-old she has made in 7 days 554.6 lbs. milk, 21.14 lbs. fat. Ryanbe Burke was dropped on Mr. Benson's farm and raised and developed there. Her dam and two other daughters of her dam and her grandam and two other daughters are in the herd.

turned milk, I imagine, but they will go further and get into the uses that the dealers make of the milk and a great big array of other details such as no man can number, or at least schedule at this moment.

It is little less surprising to the League management than to the rest of us that the milk dealers are taking so kindly to the pooling plan. They fought to the last, but for some time now not so bitterly. Of course the Nestles still fight, and there are two or three other concerns that are doing the same. One of the fighters gave in yesterday and those still at war are giving us little concern.

Besides selling milk to many dealers, the League is operating perhaps sixty plants and may have well towards eighty shortly. At these plants they are handling about one and a half million pounds of milk. There is only one other concern, the Bordens Dairy Products Company, that handles more. The flush is on now and the amount of milk is unusually large for this date since the season is earlier than usual. Butter and cheese prices have gone down greatly. This will pull down the pooling price since the make of these products is quite large. There is less condensed than for several years.

We are all asking why the dealers fought pooling so hard. Mr. Slocum, the League president, says that in most cases they fought because they did not understand. It was useless to try to explain to them in a conference meeting for the atmosphere was too hostile. It had to be done by getting them one at a time where it was possible to discuss without interruption or prompting. In this way some of them grew less antagonistic and by May first most had come to see that it might even be to their interest, and at least opposition was useless. A good lot of work during the past six months has been of this enlightening sort. It was educational work just as it has been among dairymen.

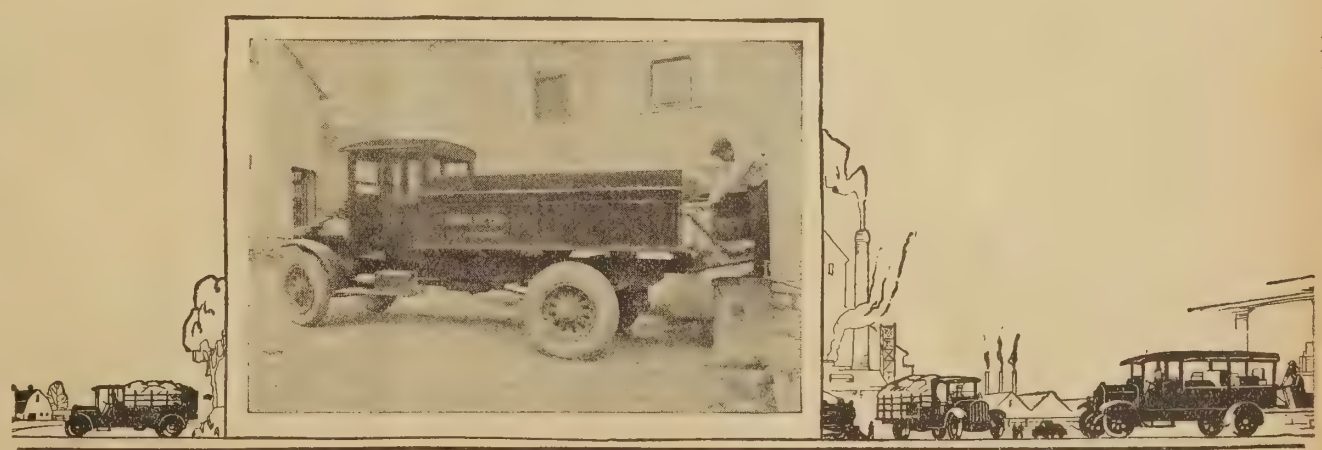
There are certain complications a little difficult to understand, yet clear to those who have the situation in hand. League milk, under the original League contract, is said to be sold until the first of October and there are strong intimations that this old New Jersey corporation may cease to function at that time. Non-pooled milk of League members is sold by this organization at the price not to exceed that to be established as a result of the pool. The dealer pays to the pool and to his non-pool patrons the same price generally until the first of October. His price depends upon the use made of the milk. In market milk territory the man outside the pool profits and in butter-making territory he loses. All gain, however, by having a fair price fixed by the organization.

As I see it now, the greatest source of trouble for the next three months is the possible, yes probable, dissatisfaction of dairymen. It is impossible to launch so large an undertaking and have everything work smoothly even if it does start almost without a jar. If affairs are reasonably adjusted by the end of the year we may expect that the co-operative has made a very successful start and has promise of long life. Many farmers are likely to look at the $2.30 for three per cent milk for May to the distributors and then at their checks which will undoubtedly read below two dollars, perhaps considerably down. They will wonder what has become of it all. We had better spend a little time right now looking at the seventy-five cent milk that goes into cheese.

Health is one of life's greatest assets for success.

You cannot get a truck that is better suited to your business than a Federal

There is a capacity built to fit your needs—a body made to meet your requirements



Federal engineers know the needs of business—and build Federal trucks to efficiently and economically fit them

Another FEDERAL

One to Seven Ton Capacities

There are few perishables that require a more exacting delivery schedule than milk. Every transportation unit must function perfectly to bring it to the final breakfast table on time. That is why Federals have gained such prestige in this field. This 1½ to 2-ton Federal pneumatic, operating near Cincinnati, is a daily source of satisfaction to Henry Meyer.

Interested in the South

J. H. McLain of South Carolina was in Washington, recently, reporting to the Dairy Division of the Department of Agriculture, closing up details of work in his hands and renewing old acquaintances. Mr. McLain is one of the dairy enthusiasts of the South to whom monuments will be erected in some future day, when the real value of dairying to the South is established; for then the southern cattle owners and creamery and cheese factory men will look back to him as the pioneer of this great development. For years up to about a year ago, Mr. McLain was in charge of dairy extension work in the southern states, and in the face of obstacles, which would have daunted less of an enthusiast, and any man not so thoroughly "sold" on the value of dairying in the scheme of general agriculture as he, struggled with his problem, until today he can put his fingers on the map of the Southland and point out areas where the dairy industry is flourishing and where the present slump in cotton doesn't mean so much as it otherwise would.

The test of McLain's enthusiasm was his willingness to put his preaching into practice, and he did it by leaving the Department and buying a farm of his own and starting there a dairy just over the state line between North and South Carolina. This is up in the lower reaches of the mountains and fine dairying section, and his dairy is making good and winning friends every day, he says. Mr McLain, more than any other one man, knows the dairy problems, the dairy situation, and the dairymen of these southern states.

CP BABCOCK FOUR BOTTLE MILK Tester

PRICE EACH $6.95

DON'T KEEP BOARDER COWS

Every dairy man needs this outfit. Points out the "boarder cow". Enables him to buy cows with his eyes open and to check up his creamery, etc. Tells him how to regulate feed to increase production. Highly recommended by U. S. Department of Agriculture, County Agents, etc.
Free with each testing machine: 4 test bottles, 1 acid measure, 1 pipette, 2 brushes, 1 bottle acid and Instruction Sheet giving complete information about testing milk and cream.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

June 9—Ayrshire Breeders' Association meets in Springfield, Mass. Secretary, J. G. Watson, Brandon, Vt.

June 22-25—Tuberculosis Eradication Conference, State House, Boston.

Mortensen Club Formed

A Mortensen Dairy Club has been organized at the Iowa State College. Professor M. Mortensen has long been the leader in the dairy department in that school, and the organization of this college club is in tribute to his work for the students there.

At the initial meeting John Schroeder was elected president; Tom Kelly, vice-president; and A. E. Hooker, secretary of the club.

Idaho State Educational Butter and Cheese Scoring Contest

An important attribute of a good buttermaker or cheesemaker is his ability to educate his patrons, to plead with them, convince them, and demonstrate to them that high quality of milk and cream will pay them the most and can be produced without much difficulty, extra labor, and money. After a good quality of cream or milk is received it is comparatively easy to turn out a product that will bring top prices, that is in demand, that will stimulate consumption, and that is a credit to the dairy industry.

This summer the University of Idaho Dairy Department is going to conduct a six months' educational butter and cheese scoring contest. Every creamery and cheese factory in the state should take part in it. The expense is very small, much may be gained. Let's see who makes the best butter and cheese. Is it produced in Southern or Northern Idaho? Let's see how much you can improve your product in one season.

The high scores will be published every month and will mean considerable advertisement to the plants concerned. Low scores will not be published and should be a stimulus for improvement. The criticisms of the judges should aid in such improvement.

A new feature of the contest is the triple score: namely, a commercial score, a composition score, and a keeping quality score. The latter scores are a valuable check for the plant operators on their product and on their workmanship, while the commercial score shows them what the market demands as to flavor, body, color, and salt.

The Place: Dairy Husbandry Department, University of Idaho, Moscow, Idaho.

The Judges: Representatives of the state or federal dairy extension service; H. A. Bendixen, Assistant Professor of Dairy Husbandry, Moscow, Idaho; and other experts that may be secured. H. A. BENDIXEN.

Trading Pure-breds for Scrubs

The Virginia State Guernsey Breeders' Association was recently reorganized and decided to launch a bull campaign in the state. They ran the following ad in one of the farm papers:

"The Virginia State Guernsey Breeders' Association has been reorganized and fifty members of this association have agreed to trade a registered Guernsey bull calf, even up, for a scrub or grade bull now used by any farmer in the state. All we ask you to do is to use this bull in your herd for two or three years just as you would your scrub or grade. Charge a reasonable fee to your neighbors and get them to use him. The bull is absolutely yours the day he arrives. No strings tied to him. He will improve the quality and quantity of your milk and double the value of every heifer he sires. This is an opportunity for fifty farmers in Virginia to get started with Guernseys without cost. Remember, an even trade for your scrub!"

It has been about six weeks since this ad appeared and up to this time they have received three hundred and thirty-nine inquiries from people that desire to trade scrub bulls for pure-breds or to buy pure-bred calves at the price the scrubs would sell for where they have no scrub bull. Some of these people ask if they can trade a heifer for a bull and one man wrote to know if he could trade an old model Ford toward a registered bull calf.

This shows the demand that there is for pure-bred Guernseys in the country at this time. We hope to put out one hundred calves in the state during the year and by doing so we feel that we will replace two thousand scrub calves with ones that will carry 50% Guernsey blood next year.

C. T. RICE, Sec.

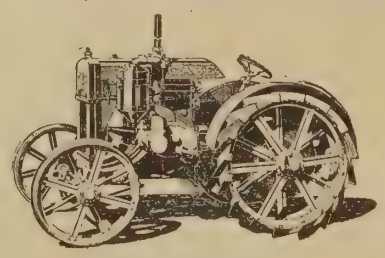
Do you Fill your Silo to its Full Capacity?

YOU dairymen and stockmen who have silos—how much space do you waste in these valuable stock feed reservoirs? If you hire a custom outfit to do the filling, the chances are that a lot of good space is going to waste in the top of your silo. As you, of course, know, freshly cut silage is bound to settle a good deal. Even with one or two men in the silo tramping down the ensilage as it is blown in, there is sure to be a noticeable amount of settling later on.

Look For The EAGLE Our Trade Mark

The Best Way to Utilize Every Foot of Silo Space

With a *Case Silo-Filling Outfit* of your own—say a *Case 10-18 H. P. Kerosene Tractor* and a *No. 10 Case Silo Filler*—you can utilize every foot of space in your silo, regardless of settling. Where the expense of bringing back a custom outfit after the first filling would be prohibitive, it's a simple matter to start up your own outfit and cut enough additional ensilage to fill the space caused by settling of the first filling. A little later on perhaps a third filling may be made. In this way no space is lost and you secure full value from your silo investment.



Only One of Many Jobs for a Case Tractor

This is only one of many jobs on the dairy and stock farm that can be handled to the best advantage with a *Case Kerosene Tractor*. Plowing, disking, seeding, haying, harvesting grain or corn, operating a feed grinder, corn husker and shredder, cylinder sheller, thresher, hay baler—on these and many other jobs Case Tractors demonstrate their efficiency, dependability and economy. Our catalog indicates why this is so. Write for a copy.

New Jersey Leaders in Georgia

The Jersey cow, You'll Do Roberta, owned by the Thomasville Live Stock Company of Georgia, has lately finished a record of 10,017.2 lbs. milk and 546.42 lbs. fat. This production made her champion junior two-year-old of the state. Only a few days after the completion of this record, Buttercup's Plymouth Girl, owned by Neal Brothers, became state champion in that class by completing a production of 9,492.3 lbs. milk and 612.96 lbs. fat.

Jersey Cattle Notes

For week ending May 13:

Number of animals registered: bulls, 241; cows, 585; total, 826. Number of transfers recorded: bulls, 254; cows, 936; total, 1,190.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, MAY 23—Before this is read the emergency tariff law will be signed by President Harding, and will be in effect. It passed the Senate as reported from Conference on May 19, and the House in the same form on May 23. The modifications of the measure agreed upon in conference had to do with the valuation section, and the dyestuff section only, the latter being limited to three months' duration, which took from it the worst of its bad features, and therefore there was no serious objection to its enactment.

The new emergency tariff puts a rate of six cents per pound on butter imported into this country. So far as butter is concerned its going into effect will be a clear-cut demonstration of just what the effect of a tariff will be on a product which is clearly subject to domestic influences as to supply and demand. Heretofore there has never been a clear-cut demonstration of this kind, as changes in the tariff rates have never been confined to a small list of articles, as is now covered in this emergency act but on a whole schedule at once, and reactions between commodities have prevented clear-cut analysis of results in any single case.

⚜

The passage of the emergency tariff also indicates that within a very short time, perhaps a few days only, the general tariff bill will be reported in the House. The willingness of the dye interests to accept three months' limitation on their pet scheme in the emergency bill indicates also their expectation, and they are a canny group with many friends in high places, that Republican leaders expect to put the regular tariff bill through in three months. It is easier to expect this to happen than it will be to make it happen. There is a long, hard contest ahead.

Dairy interests in the United States, from the man who milks the cow to the creamery owners and great commercial interests handling dairy products, have a greater stake in this general tariff than in any other question now up for settlement. The time is at hand when these interests need far keener and stronger representation in Washington than they have now.

There are three big questions right up to a settlement, and the way any one of them is settled may mean millions to the dairy industry. One is the question of reciprocity in dairy and other products with Canada, one is the tariff rate to be included in the general Act on butter and all other dairy products, the third, probably a bigger question and one which will be harder fought than either of the others, is the rate of duty to be imposed against vegetable oils.

Just because vegetable oils are included in the emergency tariff at 20 and 26 cents a gallon is no indication that this rate—and it is far from sufficiently high to give the protection needed—will be rewritten in the general bill.

The National Dairy Union, which is represented here all the time to watch oleomargarine legislation, is taking steps to bring this bigger and broader question of imported vegetable oils, and their menacing encroachment on the dairy industry, to the attention of leaders of the dairy industry generally, and A. M. Loomis, the secretary, says that he considers the situation as "one which should give deep concern to everyone who has a stake in the dairy business."

"The job is so big," he said, "that everyone has considered it someone else's business, and no concerted work is being done or has been done. There has been plenty of good hard work done by individuals, but team work is lacking. It will take team work to get a tariff of the kind essential, in the face of the people who have reasons for wanting these oils and the materials from which they are made brought in duty free, or as nearly so as they can get."

Mr. Loomis points out that, properly organized, there is a complete community of interest on this subject between the milk producers, and this includes all the pure-bred and record associations, the butter manufacturers and dealers, the cheese manufacturers and dealers, the manufacturers of pure ice cream, the dairy machinery interests, the silo manufacturers, the feed manufacturers and dealers, and the farm implement manufacturers of the North, with the cotton producers, the peanut producers, the cottonseed crushers, and the peanut oil manufacturers, and the growing dairy industry of the South—a community of interest which has never before existed on any tariff proposal or other dairy question. Thus far this community of interest has not been assembled, and is not in evidence except as a possibility.

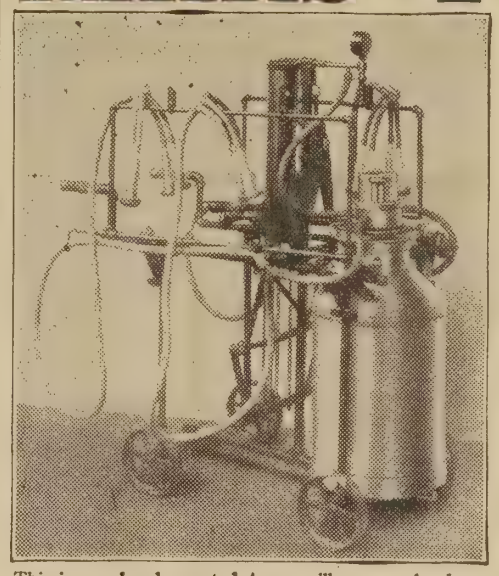
Take the cheese business for example. Since the filled cheese law was passed, this industry has been singularly free from imitation products in competition with American Cheddar cheese. With the influx of cheap oils, however, it is almost certain that, law or no law, the manufacture of cheese in which the butterfat is replaced by vegetable fats is a possibility, and a product of this kind, with these oils as cheap as they may become, could be put on the market so that it is easily likely to become a serious competitor of the real article.

The vegetable oil schedule is in the hands of the sub-committee of the Ways and Means Committee of which Congressman Nicholas Longworth of Cincinnati is chairman. As a preliminary move it might be well for men with big dairy interests to write to Congressman Longworth and ascertain his views, and the latest information on this subject. Whatever other move is made, if any, will be promptly reported in these letters.

⚜

Dr. C. W. Larson, chief of the Dairy Division, Department of Agriculture, is home from a trip to State Fair Grounds, Minnesota, to look over the ground for the Department exhibit at the Dairy Show in October. He was much pleased with the buildings and plans for the show, and upon his return here started getting the work started for the preparation of an exhibit of even more snap and interest than the last one at Chicago. "Some surprises," was all the comment he would make, "but I am not ready to disclose the plans."

⚜



The farmer organizations represented in Washington have united in an effort to get action on the Capper-Volstead collective bargaining bill, now held up in the Senate Judiciary Committee. The representatives here visited Secretary of Agriculture Wallace in a body last Friday to urge him to help in this effort. He expressed his approval of whatever was necessary to clear the way for farmers' co-operative marketing organizations, and will write his full views on the subject to any member or members of congress who may ask for his opinion.

Milks 4 Cows at Once

the Milking Machine Sensation of 1921

Costs Half; Does Double Work

(Twice the work of our 1920 model)

This is our hand-operated 4-cow milker; we also have a 2-cow milker ($123) on which we offer a free trial (exchangeable for 4-cow milkers), and gasoline engine and electric power milkers.

The *new* PAGE *4-cow* Milker—operated by hand—no gas engine—no electricity—one man milks 4 cows at once. Little work—quickly done—easiest of all machines to handle—easiest, by far, to clean; the most wonderful advance in milking machine manufacture.

We also have a 2 cow milker, only

$123!!

30 Days Free Trial!

In every locality in which we have no dealer, or agent or sales-manager, we will send *one* machine on 30 days' free trial and at our rock-bottom price, direct from the factory; to the first responsible farmer who asks for it. No deposit; no C. O. D. 30 days full free trial, you alone to decide. *ACT QUICK!*

After trial, if satisfactory keep the machine on our IRON CLAD Guarantee.

Costs Nothing to Install—Not a cent of installation expense—no engine, no motor, *nothing! Just* the machine for small herds. If you want power, get our electric or engine power outfits at $225 and up.

You milk right into your own ordinary milk can; no extra pails; no pipes; no pulsators; no tanks. Amazingly easy to clean.

Guaranteed to do the work.

Guaranteed to save time.

Guaranteed—the last word in sanitary milking (one creamery wrote us that the most sanitary milk came from farmers using the PAGE Milker).

And—

Guaranteed:

Action alterable to suit every cow separately. Instantly adapted to any cow according to her disposition and how easily or how hard she milks.

Book on Milking Sent Free!

This book is full of *important* information for the man who is thinking of getting any kind of a milking machine —**Get Posted!**

Burton Page Co., Dept. A-462
661 West Lake Street, Chicago, Ill.

Please send me your free book on milking. Also description of your new model PAGE 4 cow Milker, and your engine and electric power models. Also details of your 30-day free trial offer on the 2 cow, hand operated model.

EDITORIAL COMMENT

EXHIBITING CLEAN HERDS

We are informed by Dr. T. E. Munce, state veterinarian, that the Pennsylvania Bureau of Animal Industry recognizes the danger of fairs and live stock shows as places for disseminating disease. In order to safeguard the live stock of that state each secretary of the county or district agricultural fair association in Pennsylvania is advised about cleaning and disinfecting the live stock pavilions before placing the cattle in them. The Bureau offers the services of men to supervise this work.

At the annual meeting of the state fair associations a representative of the State Bureau of Animal Industry discussed the importance of sanitation at all live stock shows and the necessity of having each animal free from disease that was placed on exhibition. The Accredited Herd Plan was revised and the following requirements made:

"Cattle from an accredited herd or from a herd in process of accreditation, when exhibited at fairs or other live stock exhibitions, must be provided with separate sections and in such manner that they will not be exposed to other cattle.

"The federal and state live stock authorities will, as far as practicable, supervise the cleaning and disinfecting of all enclosures used for live stock exhibitions."

We heartily approve of this plan of exhibiting herds known to be free from tuberculosis. We consider it, however, a better plan that no animals should be exhibited unless it is known that they are free from tuberculosis and other diseases.

A SUCCESSFUL MILK WEEK

The Walworth County, Wisconsin, Farm Bureau conducted a milk campaign throughout the county during the week of May 16—21. At the nine trading centers of the county, meetings were held where there were discussed and pictured the food value and importance of milk and its products. The school children in each of these cities had a part and presented a play entitled "The Milk Fairies" for the purpose of emphasizing the necessity of milk for growing boys and girls. The entire county was organized, the country schools as well as the city schools, together with all the various clubs, and through this county wide organization an educational campaign was conducted in behalf of milk and its products. This is the first county in the United States to put on a milk campaign upon so broad and comprehensive a basis.

This work was organized by the farm bureau secretary, Mr. W. A. Foster, and created such an interest in the meetings that in many instances the halls were not big enough to accommodate the crowds. Storekeepers, schools, churches, women's clubs, and school children co-operated to make this milk campaign a success.

Walworth County has an understanding of the food value of milk and its products that could not have been gained in any other way in so short a time. We can highly recommend the work done there to every county throughout the United States. It not only means a larger consumption of dairy products but it means a better diet for people and especially for growing children.

FILLED MILK FOR COOKING

Since the bill to prohibit the manufacture and sale of filled milk in Wisconsin has been introduced in the legislature, manufacturers claim it is only a cooking product. A manager of a filled milk plant has written his patrons as follows: "We have built up, through national advertising and sales effort, a market for our compound product, Hebe, as a cooking liquid entirely separate and apart from the market for evaporated milk." We quote from the Hebe Co. pamphlet of 1920 entitled "Establishing a Better Knowledge of Hebe": "Use Hebe for creamed chicken, oyster, and clam stews, creamed fish; serve Hebe with tea and coffee; make delicious cream soups with Hebe; use Hebe for rice puddings, custards, etc., and a hundred other desserts." Another filled milk label states: "A sterilized high grade nutritious food product composed of fresh cow's milk; butterfat removed and highly refined cocoanut oil substituted. Two teaspoonfuls of Carolene in place of cream or milk in your coffee produce surprisingly satisfying results. * * * It can be whipped." Still another brand of filled milk says: "It can be used as milk or cream."

Do these statements lead the consumer to believe filled milk is used only for cooking purposes? The Hebe Co. in its advertising admits that Hebe is used for many purposes besides cooking. We quote: "You will use Hebe not only in desserts but in baking, in cream soups, in cream sauces of all kinds for meats, chicken, vegetables, and fish, in mashed potatoes, gravies, griddle cakes, omelets, and many other dishes." In a letter to their patrons this company claims it is only a "cooking liquid".

Why this deception when the manufacturers know that filled milk is designed to take the place of milk and cream? Some of it is labelled a compound of condensed skimmilk and cocoanut oil, but in 35 stores which handled filled milk and where purchases were made only one merchant declared it to be a compound, while some even stated it was better than the genuine product and more like whole milk. Herein lies the fraud of this so-called milk substitute. The consumer is not advised that it is a compound and not milk, and should be used for cooking purposes only. Here is an advertisement taken from the Friday, May 20th, issue of The Wisconsin State Journal: "Five cans of Silver Key Milk, 45 cents." Silver Key is not milk but a compound of skimmilk and cocoanut oil.

Further comment is unnecessary for the labels upon the cans of filled milk, pamphlets describing its various uses, and advertisements in newspapers show conclusively that its manufacturers urge its use in hundreds of ways besides cooking and that it is sold for milk.

GRADING CREAM

Those manufacturers of butter who have held it impracticable to grade cream and pay for it according to its quality are doing some real serious thinking about this method of buying cream. Some weeks ago the market price for extra butter was 32 cents a pound in Chicago and first grade butter was selling for 21 cents or less a pound. Some of the butter manufacturers lost 10 to 12 cents a pound on the butterfat purchased. Some of them now have decided that it is practical to pay for cream according to its quality and have instituted this practice. When the pocketbook nerve is hit most anything is possible.

It is not only fair that cream should be purchased according to its grade, but that which produces an inferior grade of butter should be denied a market. The manufacture of a poor quality of butter is destroying the market for butter for the consumer prefers to purchase so-called butter substitutes. Here is a statement by one of our subscribers which corroborates this:

"There is a matter that needs consideration, as I see it; you have fought the practice of using butter substitutes by people who are in sympathy with, or are, dairymen. This I have consistently done, and have spoken against its use until recently. This change is only in practice but the fact that we are not able to get good butter has caused me to use substitutes. We have access to a market that sells several brands of northern butter; among them are many brands, but it is not good, it is off in flavor. I would like to know what is the trouble. Is it because the lower grade is shipped south or is there some other reason?"

The trouble lies, to a very large degree, in the manufacturers of butter accepting all cream that is offered them. There is no butter making process known that will take poor cream and manufacture it into good butter. The manufacturers of butter must stop purchasing such cream and by paying for marketable cream according to its quality will cause the production of cream which will produce good butter. If the creameries of the country will not of their own accord correct the present evils in their business our state and national laws must be so amended that bad cream will not be made into butter. This must be done to protect the dairy farmers who are producing a good quality of raw material.

FARMING A BUSINESS

It has been stated by B. H. Hibbard of the Wisconsin College of Agriculture that "the occupation of farming is the only one in which the home and the family are closely associated. It is for this reason that the average American farmer has been content, until recently, to run his business without profit. The decade prior to 1890 was an era of cheap land but the day of cheap land has passed. The farmer of today is the user of capital, which must pay, besides other fees, charges, interest, and dividends, if he is to stay in the business."

It is our opinion that the farmer has always desired a profit but he has not kept a system of accounts which has led him to determine just what profit he has made. If, through his work and his family's, they have more money at the end of a year than they had at the beginning, it was assumed that the farm had yielded a profit. He has failed to take into account his labor or the labor of his family or the extra hours during which he worked, interest on investment, etc., in order to secure such money.

Thinking farmers are attempting to put farming upon a business basis. It is a little early to assume that the majority of farmers are seriously considering farming as a business for so few keep accounts. They are considering it as a place for building a home, utilizing the labor of their family, and are willing to do things in which very little profit can be measured.

It has been very noticeable that when certain farm products have reached prices that yield cost of production, a sufficient number of farmers have increased the production of such crops materially. There are certain sections where the farmers receive no more than cost of production for milk, as near as can be calculated, yet in those sections production has been increased. It is essential to know the cost of production in order to determine what crops are the most profitable to raise, how the farm should be managed, and to lead the farmer to see the necessity of making farming a business. This requires keeping a system of accounts. When this is done, and not until then, will farming become a business.

For a Self-sucking Cow

Please inform me how to break a cow of sucking herself.

Fort Smith, Ark. E. E. W.

We have received information from many of our subscribers telling us how they have handled this problem and have selected the following as representative of the several methods proposed:

Mr. J. V. Miller of New Mexico says: "I have tried many different methods and they have all seemed cruel to me, but the following seems to be the best. I put an old work bridle on the cow, the bit of which was divided in the middle. I know this will stop a confirmed sucker. The bits bother her for a few days but after that she does not seem to notice them. With this she can be perfectly free to move about as she desires."

Mr. J. R. Fleming of Wisconsin says: "Put a girth around cow. Place a stick between the front legs fastening one end to the girth and the other end to a ring in the halter. It is impossible for the cow to suck herself."

Mr. A. H. Coleman of Illinois writes that he has tried the method suggested by Mr. Fleming, and it

has been very satisfactory. Also, that his neighbor had used a sack over the udder but found it too much trouble. He also tried the stick and surcingle method finding it very satisfactory.

Mr. James D. Moore of Shannon, Mississippi, says: "Get a straight bar bridle bit with a hole made through its entire length. This bit should also have a slot through the center one inch long and extending into the center of the hollow bit. The cow will suck air and cannot get milk. This bit is put on with the ordinary halter or horse bridle. It should be cleaned out every day with a wire. This bit is manufactured especially for this purpose, but if not on the market an ordinary blacksmith can make it."

Mr. R. B. Cochran of Iowa says: "Place a hoop around the cow's neck just in front of the shoulder so that it will set similar to a horse collar. Put another hoop around her body just back of the forelegs. Attach these two hoops together with straight pieces of hard wood, placing them on either side and midway between the top and bottom of the hoops. In my own case, I used old buggy tires cut down so as to make a loose fitting hoop."

Fly Spray

Please give a recipe for a fly chaser to spray cows.

Arkansas City, Kans. A. D.

A good fly spray can be made from 4½ quarts coal tar dip, 4½ quarts fish oil, 3 quarts coal oil, 3 quarts whale oil, and 1½ quarts oil of tar.

Dissolve 3 lbs. laundry soap in water, add the ingredients of the spray and bring the whole up to 30 gallons with lukewarm soft water. This spray will keep off the flies and prevent the coats of the animals from becoming harsh.

The cows should be sprayed twice a day—in the morning after milking and in the afternoon when in the barn for silage or green feed. Thirty gallons of mixture will spray 40 cows 2 times a day for 10 days.

Small Diameter Silo

HOARD'S DAIRYMAN:—In a late issue, one of your readers inquired about the diameter of a silo. I have had some experience with feeding a few cattle from a 12-foot diameter silo. The stage at which the corn goes into the silo has much to do with the amount required fed off each day to avoid spoiling. If the corn is well ripened, it will not be necessary to remove as much silage in order to keep it from spoiling.

I am feeding 7 cows, 4 small heifers, and 2 horses—11 head in all—without waste. My reason for using a 12x40 foot silo is that we get more for our money. A 10x37½ foot silo holds 65 tons and costs very little less than my 12x40 and it holds 110 tons.

If our reader could get some beet pulp to cover one-half of his surface and feed off the other, say, for three or five days, then the pulp can be removed and cover the side which is lower, and so on. I have worked it this way to good advantage. Not every one can get green pulp but anyone could get some dried pulp and wet same for cover.

Utah. A. W. SCOTT.

[Editor's Note:—How many readers agree with Mr. Scott that well ripened corn spoils less at the top in daily feeding?]

First Cutting Alfalfa

HOARD'S DAIRYMAN:—The first cutting of alfalfa, largely due to its coarseness, is the least valuable of the two or three crops. In 1919 the writer pastured one field of this crop for a period of 28 days from May 1 when the cattle were taken to another pasture. The alfalfa was then left to grow until it had commenced to blossom before cutting. It retained its pea green color and was only a little coarser than ordinary second crop.

I repeated the experiment last year with very satisfactory results. The field or fields which are to be cut last should be pastured, as otherwise they get the coarsest and most overripe.

Many farmers do not pasture alfalfa because of the danger of bloating. The nearer the plant reaches maturity, the less dangerous. The writer's experience in successfully guarding against bloat caused by alfalfa is as follows: The cows should be fed all the good quality hay, corn fodder, silage, etc., they will eat, besides a liberal allowance of grain, on the morning they are first turned on the alfalfa pasture. The time they eat enough to cause bloat is when they are turned on the alfalfa while hungry. Once the stock is turned on this pasture, it should be kept there with gates closed day and night, except when watering or at milking time. When on pasture, cattle often refuse to eat other food while in the barn during the night and morning, causing them to be hungry, which may induce bloat when they are again turned into the alfalfa pasture.

Alfalfa makes such rapid growth in the spring, that it is ready to be pastured nearly a month earlier than other or permanent pasture, which makes it a very important plant for early spring pastures.

I do not think the succeeding crops were materially injured by pasturing, excepting that the yield of the first cutting may be considerably smaller. I do not consider the decrease in yield of the first cutting a drawback, as the difference in quality is sufficient to offset the difference in yield.

I am somewhat doubtful if it is advisable to pasture alfalfa in the spring where only a small acreage is grown. In such cases the hay can all be cut as soon as it is fit for cutting and none need get very rank and near maturity. It is also possible that pasturing will damage alfalfa slightly more on land which is not naturally adapted than on land which is well adapted to the growing of this crop.

Ordinarily I advise the pasturing of all alfalfa which we cannot cut within two weeks beginning from the first day it is fit to cut. What I'm pasturing now will be my best quality hay, although it will be cut last.

Wisconsin. MATH. KOENIGS.

Sweet Clover Silage and Meal

HOARD'S DAIRYMAN:—Canadian dairy farmers are becoming much interested in our newest farm crop—sweet clover. Heretofore it has been a boom crop, grown largely for seed. Hundreds of farms have lifted the mortgage on the receipt from the sale of sweet clover seed and there are many instances on record of where the seed sown in a single year was more valuable than the farm on which it was grown. Such returns led to a tremendous over-production of seed and this winter seed, that would have sold for $20 a bushel 12 months ago, is begging a market at $3 to $4 a bushel. With red and alsike clovers at $11 and $12 a bushel, there will be much more sweet clover sown than ever before.

There is a division of opinion as to the value of the crop for hay. If it is not allowed to get too coarse the first crop must be cut by the 10th of June and at that season there is little sunshine, lots of rain, and curing is almost impossible. Growers are getting around this difficulty, however, by pasturing the crop fairly heavily early in the season and then leaving so as to cut for hay in more favorable weather. There are two places, however, where sweet clover has demonstrated itself to be unexcelled—as a pasture crop and for plowing under. Sweet clover will yield more pasture to the acre than any other crop or combination of crops that has ever been tested in Canada. Moreover, it affords pasturage the whole season through. Where two crops of grain are grown in succession, and with sweet clover seed as cheap as it now is, it will be the general practice to seed down the first crop just for the humus there will be to plow under that same fall. I have seen sweet clover seeded in this way standing a foot high in the stubble for fall plowing.

Several dairy farmers have been experimenting with sweet clover for silage. At a recent meeting in Ontario, Mr. Chas. Watson of York County told of his experience. It started when he attempted to cure five acres for hay, but no progress in a week of wet weather decided him to make ensilage of it. A silo 12 by 30 was half filled and feeding commenced immediately. "The stock took to the feed quite readily," related Mr. Watson. "That was about July first and the cattle had been in pasture long enough to relish a change." In the four years since then, Mr. Watson has continued to make sweet clover silage but he is convinced that for this purpose it will never take the place of corn and warns that care must be exercised in feeding as stock is easily stalled on sweet clover.

Another dairy farmer has been turning sweet clover straw into sweet clover meal. His method is to run the sweet clover straw through a feed grinder reducing it to a meal, and he states that the first straw used in this way was from an old stack and "as black as your boot". The cows ate it all and got down on their knees to lick up the last bite in reach. When the amount was increased, however, the cows scoured badly and Mr. Hill concludes that it, too, must be fed with care. Samples submitted for analysis showed that this meal, made from green cured hay, yielded 12% protein and 30% fibre. A sample from straw tested 14% protein and 28% fibre. Another sample tested since then, however, yielded only 4.8% protein and had 51% of fibre. The subject of sweet clover meal evidently needs further investigation before definite conclusions can be made as to its value.

Canada. F. E. ELLIS.

Milking the Heifer

HOARD'S DAIRYMAN:—The first parturition is a critical time with the heifer, because at this time she may be easily spoiled. Also some of the worst kickers I have ever known have been made so by being handled in a wrong manner during the first lactation. If before beginning to milk the udder is rubbed gently and the teats taken in the hands carefully she will soon become accustomed to the preliminary handling and rubbing which good milkers indulge in before beginning to draw the milk. Suddenly seizing the teats and commencing to draw the milk may have an irritating and frightening effect upon her which is not always easily overcome.

The habits of moving about restlessly, changing from one foot to another, suddenly lifting the legs, if not actually kicking, or reaching forward and stepping backward, are all wasters of time and triers of temper. These annoying ways detract from the pleasure of milking and the best way to prevent their development is to take the best care possible of the heifer when she is beginning to give milk.

If the udder is hard or tender to the touch, as is often the case, no attempt to force the heifer into quietness by blows or angry words should be made. These may take effect just for a moment but cannot be effective long. The only permanent way to obtain the results desired is to be patient and carefully apply a good lubricant, a little fresh cream being good.

Only as much pressure should be applied to draw the milk as is necessary. No greater force than this should be used and too rapid movement will cause more irritation than anything else. Care should be taken to move the fingers properly so that the milk is always driven downwards and never by accident forced upwards. A sudden lurch or kick may often be attributed to this, as upward pressure may cause more or less pain.

Tying the legs to prevent kicking should never be resorted to unless absolutely necessary. All cows resent being hampered in this way and if there is any difficulty it is better for some one to stand at the opposite side from the milker and assist by a little cajolry, such as speaking kindly to the heifer or gently rubbing the skin particularly in the region of the tail root.

Another soother which is well worth trying is for the person assisting to stand by the heifer's head and gently scratch the part between the horns. This produces a pleasurable sensation, thus helping to detract attention from what is going on at the other end. In doing this it is preferable to stand by the shoulders close to the neck. This position is less likely to irritate than to be anywhere in front and is of course safer.

Teaching the heifer to stand properly is not always an easy manner though some heifers are wonderfully accommodating in this respect. They will stretch gently forward making it easy to reach the hind teats thus showing that they appreciate the milk being drawn. Others will persist in putting the leg nearest the milker slightly forward, hindering him considerably. The most natural way to try to alter this is to attempt to push the leg back. If this is done too roughly kicking may be encouraged which will, of course, only make matters worse.

If it is found that a slight pressure on the inside of the leg will make the heifer move back this may be done but if there is any stupidity the best thing to do is to go on milking as well as may be, hoping that there will be a voluntary movement which will bring about the desired change. If this does not come and it is impossible to proceed a gentle touch on the back of the other leg may answer the purpose. It will often be found that steady pressure on the back of the leg will induce one step forward when the same force applied to the inside of the other leg would only arouse resentment. Good habits in the cow are well worth cultivating.

Illinois. M. E. UNDERWOOD.

Champion
Dependable Spark Plugs

FOR over 10 years Champion Spark Plugs have been giving the greatest spark plug service,—for the least money.

The use of the very best materials, combined with the highest type of skilled workmanship and efficient quantity production methods, insure Champion dependable spark plugs at the lowest prices.

Over 32,000,000 were sold this past year.

New World's Record With "Champions"

On April 22nd, at Daytona, Fla., the Roamer, equipped with Champion Spark Plugs, made a new world's stock chassis record,—105.1 miles per hour.

DAIRY MARKET NEWS

Unsettled Undertone Apparent on Cheese and Butter Markets

[Report by U. S. Bureau of Markets.]

The cheese market during the week ending May 21 was characteristic of the usual period just preceding the opening of the storage season. Production is increasing and stocks of all styles are liberal on the distributing markets, while dealers are trying to keep stocks moving and floors well cleared. These conditions gave an unsettled undertone to the market with a somewhat firmer feeling toward the end of the week.

Fresh make and receipts show more grass flavor and it is expected that this week will see more active buying for storage with practically full grass flavor. The buying has been confined mostly to small lots with a few lots of 100 boxes to a carload.

Dealers, especially at country points, are proceeding cautiously. There is practically no export buying.

New Cheese Board at Plymouth

A new board to be known as the Farmers' Call Board has been organized at Plymouth, Wisconsin, and 26 cheese factories have agreed to sell their entire output on this board. The first call was at 4 p. m., May 23, in the city hall. Sales on this board as well as on the Plymouth Board will be reported by the U. S. Bureau of Markets.

Sales on the Wisconsin Cheese Exchange on Monday, May 23, resulted in the following quotations: Twins and Daisies, 12½c; Double Daisies, 12c; and Longhorns, Young Americas, and Square Prints, 13c.

On Farmers' Call Board sales were made at the following quotations: Twins, 13⅛c; Daisies, 13¾c; Double Daisies, 12¾c; Longhorns, 13¾c to 14c; Young Americas, 13⅜c to 13½c; Square Prints, 13¼c.

The average wholesale prices on American cheese (style Twins) for the week ending May 21, 1921, and for the corresponding week a year ago were as follows:

	Week ending May 21 1921	1920
	Cts.	Cts.
New York	16.2	30.5
Chicago	14.6	27.6
Boston	16.2	30.6
San Francisco	13.7	25.0
Wisconsin	14.0	28.0

The total receipts of American cheese at these markets were 4,346,314 lbs. as compared with 3,965,825 lbs. a year ago and 4,482,589 lbs. a week ago.

Butter Market

Active storage demand failed to stabilize the butter markets during the week ending May 21, until Friday. The bulk of offerings did not show good enough quality to meet storage requirements and sentiment was bearish. Inferior arrivals created a surplus which had to be pressed for sale on the open market causing daily declines averaging more than ½c a day almost to the close of the week.

Buyers for storage appeared to be very critical and this attitude helped to cause the undergrades to accumulate. New York reports that practically the only demand during the week was for butter for consumptive channels and that this trade was exceptionally heavy.

The spread between prices at Chicago and eastern markets has narrowed down recently. There has been less buying at Chicago because of the relatively high prices there and the heavy receipts of creamery butter from nearby points which have in a measure replaced some of the centralized goods.

Saturday markets were all firmer, Chicago leading with an advance of ½c to 1c. New York was still unsettled. June 90-score centralized sold down to 26¾c on the Chicago board at one time during the week but recovered on Saturday to 28¼c to 28½c.

The amount of butter produced in the Southwest centralized territory shows a reduction. For the week ending May 14, 84 plants of the American Creamery Butter Manufacturers' Association reported an increase of 32% compared with last year but a decrease of nearly 8% compared with the previous week.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending May 21, 1921, and the corresponding week a year ago were as follows:

	Week ending May 21 1921	1920
	Cts.	Cts.
New York	28.8	62.1
Chicago	28.1	56.0
Philadelphia	29.5	62.7
Boston	29.5	61.6
San Francisco	31.2	52.4

The receipts of butter at these markets were 14,930,239 lbs. as compared with 10,142,250 lbs. a year ago and 13,894,391 lbs. a week ago.

New York Butter Market

New York City, May 24:—The market has been in a somewhat unsettled condition during the past two days because of a strike of porters and truck drivers who handle dairy products and eggs. The strike is a result of a decision of boss truckmen and a sub-committee of the Industrial Relations Committee of the New York Mercantile Exchange that cartage charges should go back to the schedule put into force in July, 1919. That schedule placed the cartage charge for butter hauled from the docks and other nearby points at 6c per tub. During the past several months the charge has been 8c. Previously, the Industrial Relations Committee had recommended a reduction of wages of porters and truckmen of $3 per week, bringing the wage down to $32 per week, the maintenance of the 8-hour day, and of the "open shop". Because of the wage reduction and also because the union wished to prevent the hiring of non-union men, the strike was called. At the present time, many of the strikers are returning to work and it is probable that the strike will be broken in the near future without any concessions having been given to the union.

Because of the strike, little butter was moved yesterday either from the docks or from stores. Today, however, outside trucks have been called in and the greater part of the butter that accumulated at the docks has been removed. The trucks that are moving the butter are heavily guarded by private detectives and by city policemen. On the whole, considering the attitude of the teamsters, who are in a belligerent mood, little confusion has resulted from the strike. Strike breakers are being employed in

Straw:—Light receipts caused some advances in the straw market and higher prices were quoted in several instances. Prices at the principal markets were as follows: No. 1 wheat straw—Philadelphia $19, Baltimore $14.50, Pittsburgh $15.50, Cincinnati $12, Chicago $12, Chattanooga $23, Omaha $8, Kansas City $9; oat straw practically same as quotations on wheat straw; No. 1 rye straw—New York $24, Philadelphia $22, Baltimore $17, Pittsburgh $16, Cincinnati $18, Chicago $14, Minneapolis $9, Omaha $9.

some instances and it is understood that many of the strikers will not be allowed to return to work unless they return today or tomorrow.

There has been a constant downward trend to the market during the past week. However, the decline has not been great, although the market has been very weak the greater part of the time, the aggregate decline being only 1c. Partially because of strike conditions, but also because of an awakening of speculative demand, there was a price recovery of ½c yesterday, which has been maintained today, and there are indications that the market may harden considerably during the next few days. There is a strong probability that supplies may be somewhat excessive immediately following the calling off of the strike but it is very probable that receivers will place much of their excess supply in storage as a feeling prevails that prices during June will be at a higher level than at the present time.

On Tuesday of last week extras were quoted at 29½c. On Wednesday the market was weak and the price fell ½@1c. That was followed by successive declines of ½c on Thursday and Friday. The quotation was unchanged until yesterday when the price advanced ½c. The market was firmer today and prices of undergrades advanced ½c. Established quotations are: Extras (92 score), 28½c; higher scoring than extras (93 score or higher), 29@29½c; firsts (90—91 score), 26½@28c; firsts (88—89 score), 24½@26c; and seconds (83@87 score), 21@23½c. W. B. LIVERANCE.

Nine New Jersey Records in Eight States

Very creditable Register of Merit productions have recently been completed by Jersey cows in eight different states.

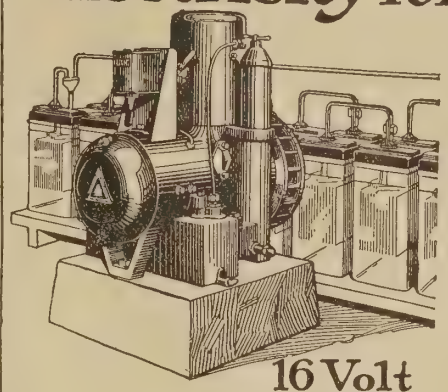
Waikiki Farm of Washington has produced a new junior three-year-old champion for that state in Glen Tana Morocco Duchess. Her record is 12,549 lbs. milk, 698 lbs. fat, the test beginning at three years and two months.

In New Mexico, Gamboge's Fox's Lady Rosette, a two-year-old owned by Meldrum Gray, has produced 11,375 lbs. milk containing 604 lbs. fat. Her record exceeds that of the previous champion of the state in this class by 100 lbs. of fat.

The agricultural college of North Carolina owns the new senior four-year-old champion of that state, Pender Eminent Lass E. This cow's production of 10,752 lbs. milk containing 564 lbs. fat exceeds the former champion of that age by nearly 100 lbs. fat.

A new state champion record in Virginia of 11,325 lbs. milk, 650 lbs. fat, has been made by the senior two-year-old, Mansfield Queen of Roses. She is owned by R. C. Vance and receives the Virginia Trophy Cup awarded by the Virginia Jersey Cattle Club for the highest percentage of butterfat for her age.

In Iowa a new junior four-year-old champion has been produced at the Waterloo Jersey Farm. Sans Aloi's Goldie has made 8,519 lbs. of milk containing 519 lbs. fat. Waterloo Jersey Farm cows now lead in six of the eight Register of Merit classes in the state of Iowa.



A senior two-year-old production of 11,242.4 lbs. milk, 636.24 lbs. fat has been completed by Sayda's King Wilhelmina, owned by S. W. Bliss & Son of Vermont. This production is the championship record for the state.

In Massachusetts, Hillside Jersey Farm furnishes a new record cow for the state in the junior four-year-old class. Madeline of Hillside has recently finished a record of 13,619.6 lbs. milk, 719.53 lbs. fat. With thirteen of her sisters, she averages 9,331 lbs. milk, 529 lbs. fat. Two of the fourteen sisters have produced over 700 lbs. fat. The sire of all is Hillside Torono.

The new state champion of New Hampshire, Clever Little Lady, is owned by Geo. M. Putnam. Her production for the year is 12,456 lbs. milk, 767.99 lbs. fat. This exceeds the previous high record for mature cows in the state by 100 lbs. of fat. Dream's Miss Jane, a stable mate of Clever Little Lady, has recently become champion senior four-year-old of the state with 12,752 lbs. milk, 718.76 lbs. fat.

Took six years to find the Milky Weigh

"I'VE been a darn fool for six years," a dairyman told us, after he used Purina Cow Chow on pasture for the first time. When he saw how much more milk he got in the late summer and fall, he knew that he had been missing a lot of good money.

One Pound of Purina Cow Chow Makes 3½ lbs. of extra milk

It not only gets you more milk now, but cows stay fresh longer and give you more milk in winter. Purina Cow Chow supplies the proteins and calcium that are deficient in grass. It keeps a cow from drawing upon the tissues of her own body to make milk. Put it to the test—your milk scales tell the tale. See a Purina dealer or write—

A Good Threshing Rig Increases Your Profits

THE value of good plowing and planting is too often lost in wasteful threshing. A clean-threshing outfit that delivers 100% of your small grain may mean the difference between profit and loss this year. It will safeguard the time, labor and money you put into your land.

Take time to select a rig that will not only serve you well this year, but will last you for many years to come.

Look into the record of the E-B Geiser Thresher for the past 60 years. Then study its construction, simplicity, ease of operation, and grain-separating and grain-cleaning ability. Ask the E-B dealer in your neighborhood why grain from E-B Geiser Threshers brings more money, or write us for the facts.

boring than has all other causes combined.

I am thoroughly in favor of the Holstein-Friesian Association standing behind the National Dairy Council, not only aiding it by the payment of money, but by the extension of every possible effort in helping along the work the council has undertaken.

Calf Clubs

One of the most essential matters for our consideration is the instilling in the mind of the growing youth on the farms of the country a love for animals and a desire to improve them. To accomplish this we must interest the children now growing up on the farms of the country. A great many different plans have been suggested for this purpose. I think, however, the one most likely to produce the result is the establishment of calf clubs, and to this end I am satisfied we should establish a department created under by-laws adapted for the purpose. I think we should create what is known as junior membership in the Holstein-Friesian Association to be awarded only to boys or girls who have successfully demonstrated their ability to rear and develop worthwhile representatives of the breed.

National Home

At the meeting at St. Paul a year ago, the Board of Directors were instructed by this body to investigate the question of the advisability of selecting a new home for the association either by purchase or erection with power to determine the location best suited to the needs of the association for years to come. No action has been taken, no expense whatever entered into to determine what locality would best serve the ends of the association for the reason that the board of directors determined that it was a bad time to purchase or build; that the association could wait a year or two until prices had receded and until somebody wanted to work and would be able to erect or purchase a building at very much less cost.

Canadian Affiliation

The Holstein-Friesian Association of Canada has become a very important organization in Holstein work. The membership embraces 3,500. Its registration as shown by 23 volumes of the herd book includes 130,500 cattle.

Canadian Holstein breeders are the best of dairymen, loyal to their organization, and enthusiastic in their devotion to its objects and purposes, and are accomplishing a grand work with the Holstein cow. It will be recalled that at our annual meeting of 1919 reciprocal arrangements were completed, whereby full recognition was given to the Canadian records (which cattle are all descended from importations recorded in our herd book) permitting under proper conditions, registrations in either herd book, each animal having first been recorded in the book of its own country. The results of this arrangement and the resulting good feeling has been greatly to the advantage of the industry in both countries. Canadian record breakers have been highly appreciated by American breeders. Since the reciprocal agreement with the Canadian Association went into effect, we have recorded in our herd book, 1,097 animals from the Canadian book, 1,031 females, and 66 males.

I sincerely trust that every member of the Holstein-Friesian Association of America will read over with

care and digest the report of the secretary, the report of the superintendent of Advanced Registry, and the report of the treasurer that they may understand fully the work of these offices, realize what they mean to the association, and realize as well the tremendous expense attached to the maintenance of the records and the extension of good will, because the secretary's records are the foundation on which our industry is built, the Advanced Registry records are the proof that our business and our industry is worth while, and the treasurer's records convey the assurance that you are financially sound.

Reed Goes to Michigan

O. E. Reed has accepted appointment as professor of dairying in the Michigan Agricultural College, taking charge of the department of dairy husbandry May 1. During the past year he has had charge of the Gossard Breeding Estates, for which position he gave up the professorship of dairying in Purdue University.

O. E. REED

Mr. Reed is a graduate from the University of Missouri. He assisted in instruction there following his graduation in 1908. Later he was instructor at Purdue, then head of the dairy department at Kansas until 1918 when he returned to Purdue as professor of dairying.

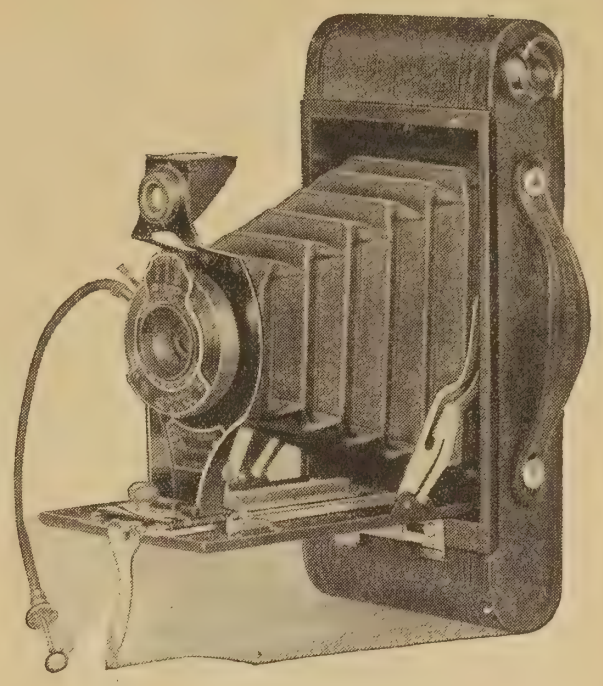
Mr. Reed's college work ranks him as one of the strongest scientific and practical leaders in dairying. He is given a hearty welcome by the college fraternity upon his return to instructional and experimental work.

Green County, Wis., Holstein Sale

Members of the Green County Holstein Breeders' Association held their regular semi-annual sale at Monroe, Wis., May 12. Sixty animals were sold for $9,465, a very fair price considering the fact that many of them were bulls from low record dams.

Roderick & Stussy topped the sale with two excellent nine-year-old cows, three-quarter sisters. They were purchased for $400 each by R. P. Ames, Wisconsin.

Mack and Eells did the selling with H. D. Schindel in the box.



Following is a list of those entries bringing $200 or more and buyers:

Sam Ubert, Wisconsin	
Lady With Netherland Mercedes 4th	$290
John Carter, Wisconsin	
De Kol King Lyons Nudine	$225

Sub. for Catalog No. 28	$230

It is a terrible indictment of our modern civilization when this great country is in the period of what almost might be called economic chaos because of our great surplus food supply, while, across the seas in both directions, almost half the world is suffering for want of food.—HENRY C. WALLACE, Secretary of Agriculture.

It is Kodak Made.

The No. 2A Folding BROWNIE

$10.00

Honest workmanship has become a habit in the Kodak factories, and it is in those factories, in the skilled hands of Kodak workmen and under Kodak superintendence, that the Brownie cameras are made.

The 2A Folding Brownie gives a happy combination of real convenience and efficiency with genuine economy. The pictures are 2½ x 4¼ inches, a really satisfactory size, yet not so large as to make the film and printing costs high. The folding feature makes it convenient to carry; the excellent finish is both durable and pleasing.

The Kodak Ball Bearing shutter, with which this camera is fitted, is quiet and certain in action. It has snap-shot speeds of 1/25, 1/50 and 1/100 of a second and the usual "time" features.

The Meniscus Achromatic lens is of excellent quality and each one is carefully tested.

Like all Kodaks and Folding Brownies, the No. 2A is autographic—provides the means for dating and titling the negatives at the time the exposure is made. This camera has two tripod sockets, a finder and an accurate focusing scale.

The price, ten dollars, includes the excise war tax and the films are but thirty cents for six exposures. Picture taking with a Brownie camera is very simple and is less expensive than you think.

Catalogue of Kodaks and Brownies free at your dealer's or by mail.

For this barn 50 x 34 with 12 ft. corners and 14 ft. gable, 8 gal. of paint will give it two coats.

To make 8 gal. of pure lead and oil paint tinted a light slate or a warm gray, requires:

100 lbs. CARTER WHITE LEAD
2 to 4 lbs. Tinting colors (ground in oil)
5 gal. Linseed Oil
1 qt. Drier (if raw oil is used)

CARTER WHITE LEAD and these other ingredients of pure paint may be purchased nearly everywhere paint is sold at retail and the dealer will cheerfully help you to figure out how much paint will be required for any painting you wish to do, what tinting colors will be required to produce the shade you select, and what it will cost at present market prices.

You will find everywhere that the cost of this pure paint is so reasonable that you can afford to paint all your farm buildings with it. You will also find **CARTER WHITE LEAD** so easy to mix and spread, to cover so well and to wear so long that your paint problem will be solved for all time.

Carter White Lead Co.

Wisconsin Holsteins Sell Well

State Sale Averages $500

Speaking from the buyer's standpoint, the Wisconsin Holstein breeders' annual state sale, held May 17 at the state fair ground, was an unqualified success. From the standpoint of the consignor this was not entirely true. Heifers, both open and bred, were most in demand and at good prices, while 30-lb. cows and those with good year records went begging at from $625 to $1,200, bargain day prices for such as these that were backed by first class breeding.

Silver Spring Farm consigned the highest priced animal of the sale, Sir Bess Ormsby Mercedes, a splendid five-year-old son of S. P. O. M. 37th. His daughters are now making good records, which fact combined with his individuality and breeding made him one of the most desirable of the sale entries. He was purchased by the Cumberland Holstein Club of Wisconsin.

The top price for females was $1,200 paid by John Puls for a 30-lb., 1,113-lb. cow sired by Sir Johanna Piebe from a good record granddaughter of Hengerveld De Kol. She was consigned by L. A. Wiese.

Three other females and one bull sold for $1,000 or more, making a total of 6 to reach that figure. The entire 65 head brought $32,360, just short of a $500 average. Out-of-state buyers came from Indiana, Illinois, and Mexico.

Haeger, Mack, and Kelley did the selling with Voss in the box.

Following is a list of those animals selling for $500 or more and buyers:

F. J. Southcott, Wisconsin	
Alice Pontiac Pet	$1050
H. E. Dickenson, Wisconsin	
Elmora Fobes Mooie	$500

Bergman Bros., Wisconsin	
King Jess Evergreen De Kol	$600
Wheeler & Smith, Wisconsin	
Colantha Gladi Parana 2d	$725

Second Illinois Holstein Sale

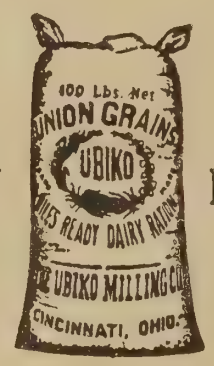
The Second Illinois State Sale held at Wheaton, May 6th, demonstrated anew the interest in pure-bred Holsteins, for beginners bought them in spite of a very discouraging money market. Seventy-six females sold for an average of $326.60.

The top of the sale was that splendid cow, Juma Longfield Homestead, who was state champion 4-year-old with 1,035.56 pounds butter in 365 days. She went to Warwood Farm, Illinois, at $1,500.

As was remarked at the close of the sale nearly all of the offering was taken by beginners and men with small herds. While a good deal of value was given for the money, the consignors seem to have been reasonably well satisfied.

On Saturday the 7th a sale of young dairy bulls was held. This bull sale was planned and put on with a view to the needs of progressive dairymen and it probably was fully as great a success as was expected. The attendance was small. But the 42 head of young bulls were pretty easily absorbed at an average of $173.50. Most of them remained in the contiguous territory. The top of the bull sale was $1,100 for the son of Buffalo Creek Farm's cow, Lavera Hortensia Bawn 2nd, with 1,050.55 pounds butter in 365 days. This calf, a nice straight, stretchy, fellow sired by a 30-lb. son of Sir Korndyke Bess, was taken by E. E. Bain of Illinois.

The same could be pretty truly said of the female sale, for breeders realize that often the price received is not the only value connected with sales of this kind. At that, the prices received were markedly better comparatively than are being received by farmers for any other farm products at the present time.



Illinois. R. N. THOMPSON, Sec.

Indiana Holstein Champion

The Holstein cow, Indiana Lizzie Alcartra, owned by Morgan Brothers, Indiana, has broken the seven-day record for two-year-olds in that state with a production of 519.4 lbs. milk containing 14.07 lbs. fat. This cow is a granddaughter of King Segis Pontiac Alcartra. Two of her junior two-year-old sisters have recently made good records. Indiana June Alcartra, as a junior two-year-old, produced in seven days 353.1 lbs. of milk containing 16.02 lbs. fat, and Indiana Lucile Alcartra 387.6 lbs. of milk containing 13.71 lbs. fat.

Fox River Valley Guernsey Sale

Members of the Fox River Valley Guernsey Breeders' Association held a very successful sale at Appleton, Wis., May 6, selling 52 head for $14,835, just short of a $300 average. The 44 females sold brought exactly a $300 average, the 7 bulls $214.

These are really excellent figures considering the fact that $520 was the top price of the sale. Fred Sy, Wisconsin, paid this for Susan of Homestead 2d, a yearling granddaughter of Imp. Hayes Cherub 2d from an A. R. granddaughter of Governor of the Chene. She was consigned by Jamison Bros.

A brother to this heifer from the same herd was the highest priced bull, going to Walter Behnard for $435.

Love and Benjamin did the selling with Chas. L. Hill in the box.

Following is a list of those animals selling for $250 or more:

E H. Kerklin, Wisconsin	
Paget's Tidy	$310
Louis W. Glocke, Wisconsin	
Polly of Homestead	$325
Harry Lewis, Wisconsin	
Queen Greta's Daughter of Homestead	$325

Creditable Guernsey Records Recently Completed

Among the good records completed by Guernsey cows recently is that of Ollie's Princess of Windermere, the new champion class AA Guernsey cow of Illinois. Her production is 13,341.9 lbs. milk and 793.67 lbs. of butter. She replaces her stable mate, Contrafuria, by a margin of 48 lbs. and secures fifth rank in Class AA for the breed. She is owned by F. K. Babson of Four Pine Farm.

In Virginia, Aimable's Belle of Inverness, owned by J. P. Agnew, has completed a production of 10,591.9 lbs. of milk and 572.63 lbs. of fat in Class EE. This rates her as a champion in her class for the state.

May Rose Leda of Jean du Luth is the new champion class FF cow of the breed in Minnesota, replacing her stable mate, May Rose Dally, in this class. The champion's record is 10,770.6 lbs. of milk and 569.94 lbs. of fat.

Valley Gem Farms of Washington have made an unusual record in their first testing. Two of the first three cows put on for Advanced Registry work have qualified for class leadership, and the third was a close competitor. Nan of Birchwood now holds second place in Class EE with 12,932.8 lbs. of milk and 627.13 lbs. of fat, and Gana of Valley Gem holds fourth place in Class GG with 13,285.1 lbs. milk and 632.85 lbs. fat. A three-fourths sister of Nan of Birchwood produced 10,419.2 lbs. milk and 543.79 lbs. fat in Class EE.

Broad Ripple Farm Guernseys Sold

The dispersion of the Broad Ripple Farm Guernsey herd at Waukesha, Wis., May 19, drew but a small crowd although most of these were buyers.

The 39 head offered brought $11,580 with $1,150 the top price, Geo. and J. W. Konrad paid this for Duchess of Maple Hill, a wonderfully good six-year-old daughter of Langwater Hayes Rosie's King of the May from a good daughter of May King's Vrangue of Ingleside. Added to her breeding and excellent individuality was her record of 535.92 lbs. fat as a yearling, making her a bargain even at the price.

Love and Benjamin did the selling with Sale Manager F. E. Fox in the box.

Following is a list of those animals selling for $300 or more, prices, and buyers:

Theo. Gloeckler, Wisconsin	
Bessie's Yeksa Starlight	$320
Creamland Blanch	320
B. M. Caples, Wisconsin	
Cooper's Lady Richmond	$330
Creamland Agnes	370
Lord's Dottie of Tillybarden	380
R. R. Schuartz, Wisconsin	
Creamland Faith	$350

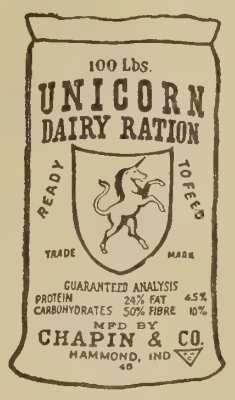
Rex of Broad Ripple	$550
J. L. Davis, Wisconsin	
Sunnybrook Mignonette	$425



Do Good Cows Need Grain?

Grass alone will not keep your heavy milking cows doing their best.

Start feeding grain *before* they begin shrinking in milk flow or become thin from insufficient feed.

Remember that when a cow falls off in production, due to lack of feed, it is nearly impossible to get her up until she freshens again.

Grain fed *now* will pay you a profit in many ways:

1. More milk every day—for more days.
2. Cows freshening in the fall will keep in good condition and not require so much extra grain to get them in proper shape.
3. Cows fed grain now will produce more heavily next winter on the same amount of feed because their reserve flesh will not have been used up while on grass.
4. By feeding grain now and keeping cows in tip-top shape, vigorous calves are assured.

Unicorn Dairy Ration and home-grown grains, half and half, make an ideal ration with fair pasture.

As pastures become poor, increase the amount of Unicorn and decrease the home-grown grains.

Do not forget that Unicorn Dairy Ration gives the cow the necessary factors of PALATABILITY, BULK, VARIETY and SAFETY, with an ample supply of proteins and mineral matter.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Filling the Corn Popper

[Continued]

"Every one here!" greeted Bruce's father to the all ready assembled members of The Poppers who had gathered for their final instructions for the work of the club to which they had all pledged themselves.

"All but them Callenbach twins," Bill triumphantly announced after glancing over the crowd of enthusiastic juniors, as if to emphasize the fact that his presence in the club would be the means of keeping them out. "I didn't think they would stick," he added bombastically. "They hain't much on doing any more than they have to," and he broke forth into a forced guffaw in which he apparently expected some of the others to join. But in this he failed, for his coarse remarks were reflected in a cloud of disgust from the expectant faces of his friends.

"Let's wait a few minutes, dad," Bruce suggested. "They'll be here all right, you can just bank on that. When they say they'll do a thing, they'll stick and besides they have more work to do than any other one of this club, yes, or any two of us put together. They work, they do! I've seen them and believe me their dad doesn't let them loaf on the job," and he stared straight into big Bill's sullen face as he spoke.

That the part Bruce had taken in defending the twins was well taken was evidenced on all sides from smiles and nods to clapping of the hands, and Bill was silenced for the time at least. "Here they are now," Bruce shouted, glancing in the direction of the opened front gate. "I knew they'd come," and he dashed forward to greet them.

"Good evening, boys," said Mr. Carter, stepping outside the circle as he extended a hand to each of them. "We were just a little worried that you had backed out," he remarked good naturedly.

"Naw, we wouldn't do anything like that," Jake grinned in his bold way so that every tooth in the front of his square, chubby face was exposed to full view. "We wanted to quit work early today so's we could get an early start, but dad made us keep planting right up to six o'clock and then after that we had to eat our supper and do all the chores, and alone, too, 'cause he and ma went to town right after supper to do some trading, so's he wouldn't have to waste any time going tomorrow," the other twin volunteered, and all in a single breath, so anxious was he to justify their tardiness.

"Well, never mind, boys," said Mr. Carter sympathetically, "we are glad that you have come and now we can go to work." The twins were received into the circle of their neighborhood companions with a genuine boyish interest and there was not one, other than big Bill, who was not glad that they had come.

"Now, boys," said Mr. Carter after all had sunk into comfortable positions upon the soft green grass of the well kept lawn, "we will get down to business. Bruce and I have figured it out that if we each grow a quarter of an acre of pop corn, there at least will be enough to supply the neighborhood even if some of us do not have a very good crop and also that this much land will be placing us on a businesslike basis. And I want to say right here, boys, that, although it may seem like a very small matter to grow that much, it will be quite a problem for each of us to do ourselves. Helping dad with his crop is one thing, but to grow a crop of your own is quite another when you have to do all the work alone."

"I don't think that dad will allow us that much land," Jake interrupted as he arose and shifted uneasily about in the coarse, dusty cowhides that covered his feet. He told us at noon today when we were talking about it that all we could have is a strip just back of the barnyard and I don't think that is a quarter of an acre. You know the piece I mean, Jimmy, the one where we drowned out that woodchuck a couple of weeks ago."

"Why, that's more than a quarter of an acre," Jimmy answered, "and you are lucky to get that, too, because it is so near the barnyard. All you'll have to do is to pitch the manure right over the fence and you know corn likes plenty of that stuff. Sure that is enough ground," he assured him, "and you'll beat us all with that piece. I think your dad is just playing right into your hands by giving you that piece. I'd say you are lucky fellows!"

"Well, maybe if you think it is all right, it is," he assented somewhat reluctantly. "It doesn't matter anyway, for that's all dad will let us have this year."

"I wouldn't worry about that, Jake," encouraged Mr. Carter. "You'll find that there will be plenty of ground for our purpose and probably enough in addition for some melons."

"Sure there's enough," added the other twin. "I heard dad telling ma that he hated to let us have that half acre because he wanted it for potatoes. Yes, I am sure he said a half acre," he reflected, "and I'll take dad's word, he's usually right when it comes to a show down."

"That's the spirit I like to see, boys," resumed Mr. Carter, "and now that Jake has his ground, we'll proceed. I want to say something about what Jimmy suggested a moment ago regarding the use of manure for corn. Corn wants a lot of that stuff we call fertility if we expect it to make a good growth. I guess we all know that judging from the way the manure has been going onto the land this spring, and I dare say that many of us have hands that will testify to that fact," he laughed. "But I just want to emphasize this in connection with our club work. Pop corn is like any other kind of corn in this respect and I hope that we are all planning for a bumper crop and plenty of manure will go a long way in producing it. How about it, Jake, do you think that you will be able to give your quarter of an acre a liberal dressing of manure?" he asked.

"Sure I will, if my hands hold out that long," he grinned. "They're pretty sore tonight," he explained as he picked at the numerous hard callouses that the fork had made on the palms of his hands. "I'll get it there though," he added as he bashfully drooped his head.

"That will be splendid," enthused Mr. Carter, "and I hope that we can all be depended upon to do that very thing. In fact, right in this connection, I have something in mind that I was going to tell you all later on in the evening, but I guess I might just as well let it out now."

ANXIOUS TO SEE THE JUNIOR PAGE

At the mention of this, every one was instantly alert, including Bill who since the arrival of the twins had seemed to be rather dejected. "Gee, I wonder what he's going to say," whispered Jake to his nearest neighbor, who happened to be Jimmy Webb.

"I don't know, but I'll bet I can guess," returned Jimmy in an undertone, but sufficiently audible so as to be heard. "He's going to offer a prize of some kind to the one that grows the biggest crop of the best quality. You wait and see!"

"Exactly what I am going to do, Jimmy," Mr. Carter smiled. "There is to be a prize of some kind for the one of us who has the largest crop. Just what it will be, I am unable to say at present, but I can assure you all that it will be something that any boy will be glad to have."

"Do you know what it is going to be?" whispered the other twin to Bruce. "No, I don't know any more about it than you do," he answered. "I'll be the last one to know it too," he added.

"No, you needn't try to guess what it is going to be, boys," he remarked as he noted the eager looks on the faces and the earnest whisperings that were passing back and forth. "And I'm not doing this to make each of us do his best, for we will all do that anyway, but I do think that we should reward the member who can claim the distinction of doing the best job. And when the prize is awarded we will all be together in just such a meeting as we are having tonight, so until the time comes no one will know who the winner is or what the prize is to be. How does that strike you?" he concluded.

"What do you think about it, Bill?" he asked, evidently making an attempt to cheer him up. "Do you think that you can compete with all these fellows and stand some show of winning?"

"Yes, with all excepting Bruce," he answered sulkily. "He's got the advantage over all of us, 'cause you can help him so much."

"All right then, Bill, I'll stay out of that part of the program, if you think that will be fairer," Bruce snapped.

"I should say not," Jimmy broke in. "There isn't any reason why we should not trust our leader. No, sir, Bruce is in on it and I'd laugh if he happened to win the prize. Come on out of it, Bill, you big baby! If you're going to whine like that instead of getting down to business, we'll all beat you to it." And before any one could say a thing further, he asked, "How many here are in favor of Bruce competing for the prize with the rest of us? Say Aye." Instantly so many voices spoke the word that it seemed as if there were a hundred or more present instead of the enthusiastic twenty-five. "That's settled then, Mr. Carter," he concluded, "now we can go on."

"Jimmy's right, Bill," continued Mr. Carter. "You can trust me for playing square and I doubt if Bruce will get as much help from me as the rest of you. I want him to find out many things for himself. And I want you all to do this too. Make the job just as much your own as you can. The fellow who assumes the greatest responsibility is the one who usually wins. Bob Ramsay is a good example of that and you surely have all read the stories about Bob and Jimmy Greene in Hoard's Dairyman."

"This seed has all been tested, boys," he said, as he lifted a small sack from a basket at his side containing many others. And it is all the same kind of seed too, so that no one can claim any advantage there. It's the best kind of pop corn to grow, because it's the favored Baby White Rice. There is really more than enough in each sack to plant a quarter of an acre, and I don't want you to think that all of it must be planted. If you plant from four to five kernels to a hill, that will be plenty because, if it is planted thicker, there will be too many plants and they will not yield as well. But since pop corn is smaller than field corn, I think we may well plant the rows a little closer together, say about three feet each way instead of three feet six inches. And speaking of planting makes me think of another thing. We should aim to have the patch looking as good as possible. So the straighter the rows the better it will look, and the easier it will be to cultivate it. Now are

there any questions as far as we have gone?"

"I'd like to know what is the best way to make straight rows," the other twin shot out, and how are we to plant it?"

"That's a good sensible question," commented Mr. Carter, "and I'll call on Bill to answer it."

But Bill was not in a position to answer a question like this. In fact, he hardly knew what the question was so interested had he been in poking fun at the questioner. The insolent sneer quickly left his reddened face which colored deeper and deeper as he dropped his head, saying as he did so, "I don't know."

"I'm so sorry I asked you, Bill," Mr. Carter excused himself, "but I thought you knew judging from the way you acted." This little bit of honest sarcasm served its purpose admirably and Bill felt very much chagrined.

"Perhaps Jake can tell you," suggested Mr. Carter. "How about it, Jake?"

"That's easy," Jake put in with eagerness. "We've got an old marker at home that dad used to use. I guess brother doesn't know where it is, but I do and I saw it just the other day when I was searching for eggs in the old shed. We'll just use that to make the straight rows and then we can use the old hand planter to plant it with," he concluded with a satisfaction that he had answered the question right.

"Well, that is one way," Mr. Carter approved, "but I don't see any reason why you can't use the regular corn planter," he suggested. "All you will have to do is to set the planter a little closer so that too many kernels will not be dropped in a hill. This will be the quickest way to do the job and it won't be so much work either. That's the way Bruce will plant his and so I am going to suggest that you all do the same if you have a planter on your farm. Jake's way is all right though and he can use it if he wants to.

"But the real work will begin when the corn starts to come up because then the weeds are starting also, and we'll all have to do our very best to fight them. The cleaner your patch is kept the better are your chances for winning the prize and it won't be at all out of place to use the hoe in addition to the cultivator."

Here he paused as he wrinkled his brow as if in deep thought. Finally he asked, "I wonder if there are any boys here in this club who can give the reasons for cultivating corn!" Up shot a dozen or more hands. "All right, Jake, we'll let you tell us," he said.

Jake feeling the importance of the position in which this recognition placed him, rose to his feet and began. "First of all we do this to keep the weeds down, because if we don't they will take too much of the water and food from the soil and besides will crowd the corn plants too much when they are small by taking up too much of the space and shading the plants. Besides this," and here he gulped once or twice for he was talking very rapidly, "the roots of the weeds crowd the roots of the corn plants and that is bad too."

"That is very good, Jake, and it is exactly right. I couldn't have said it better myself, but still I can think of one or two more reasons," Mr. Carter suggested. "So can I," Jake shot out as he quickly arose to his feet again. "But I thought you just meant about the weeds."

"No I meant all about cultivation, Jake," he answered.

"Well, sometimes a crust forms over the soil after a heavy rain and then it is a good plan to cultivate to break the crust. It loosens up the soil and lets the air in and the roots of plants have to have air as well as the leaves," he added, "anyway that's what our teacher told us when we studied about corn."

"Your teacher was right," commented Mr. Carter, "and I am glad that you mentioned this point."

"I know another reason," interjected Jake's brother without waiting to be recognized."

"Well, what is it?" asked Mr. Carter turning in his direction.

"It's to keep the moisture in the soil by keeping a loose surface. If we don't do that the soil dries out faster and if we have dry weather very long, it may hurt the young corn plants."

"That is also very good," approved their leader, "and I am quite surprised to find that you know so much about this subject. The reasons have been well stated and with sufficient clearness to make us all appreciate why we should keep our corn fields clean."

"Now unless there are questions which any of you may have, we'll call this part of the program done as soon as Bruce and Jimmy get these sacks of seeds distributed."

"Wonder if we'll get any ice cream tonight," Jake whispered to his neighbor, and a disappointed look spread over his face when he heard Mr. Carter announce that this would be all he had to say for this meeting.

"But before you go," he added, "I want you all to come into the house for awhile," and he started to lead the way.

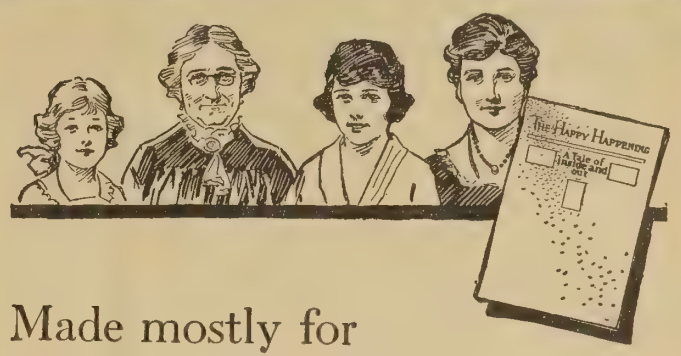
Instantly Jake was on his feet hurrying to the side of Mr. Carter. He was pretty sure that his hopes of refreshments were to be realized for what other reason could Mr. Carter have for asking them in. But again he was disappointed for as soon as they had all been seated, Mrs. Carter started to entertain them on the piano, accompanied by Bruce on the violin. The selection was a difficult one and the boys marveled with envy the skill with which their playmate handled the bow. Each number that was played was applauded with more enthusiasm than the preceding one and it was not until most of the songs familiar to their boyhood had been played that they evidenced satisfaction. To be sure, Jake had enjoyed all this, but his spirits rose about fifty per cent when he heard Mrs. Carter telling Bruce that it was time to serve the ice cream and cake.

"You deserve the first dish, Jake," laughed Bruce as he entered with the loaded tray, "for telling us so much about why we should keep our corn patch clean," and before he had passed on to the next one, Jake had made away with at least two heaping spoonfuls of the delicious luxury, and no one excepting Bruce knew of the second dish which he greedily devoured.

That night as Jake and his twin were preparing for bed, he remarked, "Say, Pete, do you think dad is playing into our hands, as Jimmy says, by giving us that piece of ground for our pop corn?"

Junior Letter

Hoard's Dairyman Juniors:—I have two little pigs that will weigh about 26 lbs. each. I also have a sow which will have little ones some time in July. I think I will sell my pigs.



Father has a black sow which had 11 little pigs; she laid on one but she has the rest. Father sold six. They are seven weeks old today.

One of our cows got a little calf recently. We have four other ones coming in now most any time.

Father and I plowed yesterday although it was almost too wet. We have only about two days' plowing yet with two teams in the corn ground.

Pennsylvania. William Gemberty.

Lowe Brothers

Made mostly for women—but used by many men

IT was made for women from 14 to 74. It was made by a woman, and put together by a man. It's color is blue, because it stands for happiness. It's name is the Happy Happening, because it makes happiness happen. Makes it happen to homes, either inside or out. Among 98 other things, it has to do with Mother's kitchen and Father's automobile.

It costs you nothing, but its bound to save you much. It's one of those things it is best not to borrow, because you will never want to return it.

If you will send us 10 cents with your name and address, and just say: "Send the Happy Happening"; along will come one of your own by return mail.

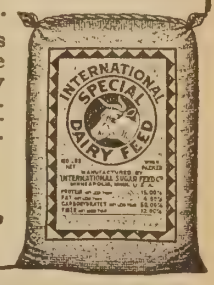
Paints

WHAT IS GRASS ANYWAY?

"What sort of a magic food is it that it should be considered a perfect feed for dairy cows? The answer is that grass is practically hay with water in it, and what farmer that even pretends to keep cows would think of feeding his stock on moist hay all winter? Yet that is all the feed the poor cow usually gets throughout the summer."
—A. C. Palmer, in Hoard's Dairyman.



AVOID SUMMER UNDERFEEDING

Use International Special Dairy Feed

Green grass stimulates milk flows—for a time. Then there's a reaction and in early fall the cow is about done for the year. That means winter feed put into a dead mechanism.

International Special Dairy Feed fed with grass keeps cows prime and milk flows A-No. 1. One feeder reports an increase of 4 gallons per day from 11 cows after feeding International Special Dairy. We absolutely guarantee a milk increase and continued satisfaction. Buy now. The price is right where you want it.

See your dealer now. Write us if he cannot supply you.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Position Wanted—As cow tester, distributor or manager. Address BOX 773, care Hoard's Dairyman.

Mexico Wants Dairy Cows

HOARD'S DAIRYMAN:—According to J. F. Ivey and J. T. Cornelius of Texas, who have just returned from Monterey, Mex., where they went with a carload of Jersey cows, there is a big demand in that country for this class of animals. They report that sales were readily made and that the call for more was urgent. Another carload will be made up for immediate shipment to that city. Mr. Ivey, being thoroughly conversant with the Spanish language and having an excellent understanding of conditions, will take up his residence in Monterey to care for the selling end of their business, while Mr. Cornelius will remain in Texas and look after purchasing and shipping. This first shipment was made by express via Laredo, but the next will go via Brownsville in the hope that better rates and service may be had.

Mr. Ivey states that, contrary to reports, affairs in the southern republic are assuming normal, and that while business is necessarily a little backward, due to the long period of revolution, the people as a whole are hopeful and forcing things ahead in a very encouraging manner.

Texas. W. D. HORNADAY.

Waupaca Guernsey Sale a Success

The Guernsey sale held at Waupaca, Wis., May 5th, under the supervision of the Waupaca County Guernsey Breeders' Association was a decided success. No big prices were paid but the bidding was brisk and the animals were in excellent condition. Considering the fact that this was the first Guernsey consignment sale ever held in the county the consignors should be congratulated on their excellent showing. The attendance of about 700 indicates a rapidly growing interest in good Guernseys in this county and there is no doubt but that Waupaca County will soon stand out as the place to buy high class animals of this breed.

The highest priced animal, Fortune's Hope, was consigned by L. S. Murat and purchased by Ernest Weiland, Wisconsin, for $425. F. J. Reuping purchased Alvilda's Beauty of Major for $400. She was consigned by Chris Joch & Son of Weyauwega. Laura's American Pansey also sold for $400. She was consigned by Ben Jacklin & Sons and purchased by Mrs. Pope West.

Auctioneers Love and Benjamin did the selling assisted by Chris R. Joch. Gavin McKerrow acted as pedigree expert.

Following is the list of animals selling for $300 or more and purchasers:

L M Rowe, Wisconsin	
Jewel's Romona	$380
M L. Mills, Wisconsin	
Linetta's Una Young	$310
J H Regan, Wisconsin	
Weyauwega Daisy	$300
Mrs Pope West, Wisconsin	
Laura's American Pansey	$400
F J. Rueping. Wisconsin	
Alvilda's Beauty of Major	$400
Oscar Moe, Wisconsin	
Bob's H. S. Lily	$325
McKerrow Farms, Wisconsin	
Verna of Hillside II	$300
Ernest Weiland, Wisconsin	
Fortune's Hope	$425
B F. Sheridan, Wisconsin	
Lord Yeomans Bessie of Braeside	$330
A. A Glocke, Wisconsin	
Beauty of Clover Leaf	$375

County Agent and Farm Bureau

The printed agreement between the States Relations Service and the American Farm Bureau Federation, defining the relationship between the county agent and the Farm Bureau, is off the press. The agreement states:

"The County Farm Bureau is a voluntary organization of people engaged in farming and has for its object the promotion of the economic and social interests of agriculture, including research and education, the farm home and the rural community. It is non-secret, non-partisan, and non-sectarian, and it is its policy as an organization not to engage in commercial activities. It is open to both men and women on equal terms. While it may engage in other activities it is greatly interested in the promotion of the co-operative extension work in agriculture and home economics organized by the state agricultural colleges and the United States Department of Agriculture under the Smith-Lever Extension Act and related federal and state laws. It may, therefore, co-operate with the Extension Service of the State Agricultural College and the Department by contributing of its funds toward the maintenance of one or more extension agents in the county and joining in the work of the Extension Service through its committees and otherwise under agreements with the state extension director. The farm bureau is organized with a president, secretary, treasurer, and executive committee, who will themselves, or through other representatives of the farm bureau. solicit memberships, collect dues, handle its funds, and in general manage its affairs."

Dispersal of
A Great Ormsby Herd

Owatonna Minnesota — **71 HEAD** — **June 16th 1921**

TAYLOR AND CHRISTGAU, well-known Holstein breeders of Owatonna, are dissolving partnership and will disperse their entire herd of 65 head of exceptionally well-bred, large, typy animals at Public Sale on June 16th, sale starting at 10:30 a. m.

Central New York Dairy Notes

State Fair Prizes for Calf Club Work—Competition will be keen in the state this year in junior calf club work. A fine list of premiums has been compiled, the Holstein-Friesian Association, the Guernsey Cattle Club, the Ayrshire Breeders' Association, the New York State Bankers' Association and the Fair Commission co-operating to insure attractive inducements. Besides the two-year-old Sabin prize bull, Prince Alcartra Segis, offered by the Bankers' Association for the best junior achievement, to become the permanent property of any county only after being won three times, there will doubtless be several prize bull calves for winners. The Sabin bull was last year won by Otsego County juniors and is with them now.

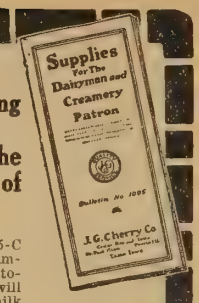
For individual awards in Holstein calves under 1 year, the first prize will be $24; second, $20; third, $16; fourth, $10; and fifth, $5. Only three prizes are offered for Guernsey calves the same as the first three under Holsteins.

Cow Testing Associations—Franklin County has a new cow testing association in which there seems much interest. Tioga County's test work is being carried out very successfully. Tompkins County dairymen are discussing starting an association.

Health Train Busy—Miss Anne Raymond of the Child Health Organization is busy for the month telling thousands of children of the 18 counties of the state on the New York Central lines all about the need of drinking milk and of eating vegetables in order to become strong and healthy. In Syracuse and many surrounding towns the Jolly Jester Clown is doing similar work while Happy, another health clown, is in Cortland and other places under the auspices of the tuberculosis clinics, teaching the same wholesome doctrines. Observers of the work done by these people say that school children will absorb and put into practice truths taught in this striking happy way with an enthusiasm impossible to arouse in any other way. About one-third of the school children are found to be undernourished and want is not always the cause. Thoughtlessness and indulgence on the part of parents cut a bigger figure than does poverty. Wrong food habits are also largely to blame.

New York. E. F.

Washburn County Holstein Breeders Organize



Twenty enthusiastic breeders of Washburn County, Wisconsin, met October 2, 1920, and organized a Holstein Association for that county. At the end of eight months, this organization is now numbered among the very best in the state. A picnic to celebrate its work is planned for June 10, when the following speakers will address the Association: L. L. Oldham, George C. Humphrey, and R. H. Rasmussen.

Two New Jersey Champions Illinois

Two Jersey cows owned by L. & C. Mason of Illinois have each become state champions in their classes. Lady Fox Pedro having produced 10,879 lbs. milk containing 587 lbs. fat now heads the junior three-year-olds. Miss E. P. Garnet began her test as a senior four-year-old and produced 11,804 lbs. milk containing 572 lbs. fat which makes her the new champion of the state for that class.

Pure-bred stock means better animals, more profits, more prosperous farmers and pleasanter farm homes.

Tips on Collecting Bigger Cream Checks From the Same Number of Cows

Our Bulletin 1005-C shows a number of simple, inexpensive up-to-date devices that will help you to deliver milk and cream in such a prime condition that the creamery will pay top-notch prices for it.

This Bulletin shows how the small producer with only ½ dozen cows can handle his milk and cream in the same sanitary and scientific way as the big fancy dairies and get the same fancy price for his products.

The Bulletin is free. A post card request will bring it.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Infectious Scours of Calves

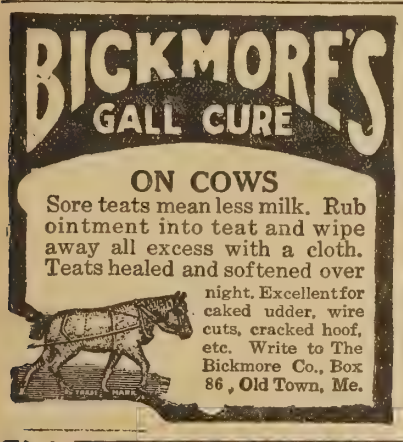
The deadly form of dysentery of new born calves popularly known as "calf cholera" or "white scours" is infectious, being caused by germs of the colon bacillus type. Other germs, including the bacillus abortus of Bang and another causing pneumonia are, no doubt, in some cases associated with the colon bacillus, so that a mixed infection is present. The germs enter by way of the navel (umbilicus) in the womb, or vagina, or just after birth. Infection may also occur by way of the mouth.

The affected calf within a few hours or days of birth becomes "deathly sick", stops nursing, lies down, tucks its head into its side, appears partially unconscious, scours, weakens, dies, and quickly becomes bloated and decomposed. In some cases the calf bloats or bawls from birth and is so puny and weak that it is termed a "living abortion" by the attendant. Medicinal treatment rarely succeeds, but changing the ration of the pregnant cow and not allowing the calf to take its mother's milk at birth may lessen the liability to attack.

Preventive measures generally prove effectual if thoroughly and persistently applied. Immunization of new born calves with polyvalent calf dysenteric serum does not suffice. That treatment should, however, be given to each new born calf on every farm where the disease has been prevalent, and our readers should at once consult their veterinarians about the matter. It is likewise necessary to put into effect the following prophylactic measures: The calf at birth should at once be placed in a perfectly clean, disinfected, whitewashed, light, well bedded, and well ventilated box stall in which a case of white scours has never occurred. There should be at least two such box stalls or pens on every small dairy farm and several of them where many cows are kept. After use by one calf the pen should be thoroughly cleansed, disinfected, and freshly bedded in readiness for the next.

The moment the navel cord has been severed, liquids present in its stump should be squeezed out and the part saturated with tincture of iodin, and then frequently dusted with powdered starch. If the cord does not quickly shrivel and dry more tincture should be applied. Hypodermic treatment with polyvalent serum against dysentery should also be given instantly at birth. Before allowing the calf to nurse for the first time the cow's udder and teats should be cleansed and then disinfected with a saturated solution of boric acid, and this should be done daily for at least a week if the calf is allowed to suck. Care must also be taken to prevent contamination of the udder by discharges from the vagina of the cow. With that end in view the vagina should be syringed out daily with a mild antiseptic solution prescribed by the attending veterinarian, and the tail should also be kept clean.

It may be added that experiments have been made in immunizing the pregnant cow with biologics, so that her calf will not contract the disease, but thus far the treatment scarcely has proved sufficiently successful to warrant general use. The polyvalent serum, fairly effective as a preventive of the disease, has also considerable merit as a remedial agent and should be used at once in that way should a calf start scouring.



Distemper

Our horse has distemper. Will our two cows take it, especially when allowed to drink from the same vessel? If they do take it, will not the disease unfit their milk for use in the home? I hold that it will do so. I fear for my children to use the milk. Can not something be done to help distemper?

Maryland. (MRS.) C. H.

Distemper (strangles) of the horse is not communicable to man or cattle, but affected animals should be watered from pails. That is, of course, a sanitary measure which should be adopted when an animal is afflicted with any disease. If a description of the symptoms is furnished we shall be glad to prescribe treatment. The term "distemper" is often erroneously applied and one should be careful lest glanders be the real disease present. That disease is communicable to men.

A study of one of the best agricultural counties in New York State shows that 55 per cent of the farms have automobiles and that over 50 per cent of the use of automobiles is for business purposes.

"FEED UP"—and What This Means to Every Dairyman

THE first flush of grass, and the way cows avail themselves of it, tempts many dairymen to reduce the amount of feed at this time of the year.

This is the wise thing to do, but for a short time only.

Start feeding again lightly after the first flush of grass, or your cows will shrink to such an extent that they will not come back strong for the fall work.

If you feed *Buffalo Corn Gluten Feed*, with a fair amount of mill feed, your cows should give from three to four pounds of milk per pound of grain fed.

Your herd needs Buffalo Corn Gluten Feed—in summer as well as in winter—in order to make it a real source of profit to you.

You cannot afford to overlook these facts, or neglect to take a broad view of the cost and return from your herd. Then you will order Buffalo Corn Gluten Feed.

Association Notes

(Continued from page 819)

—I. V. Otto made the first 30-lb. record to be made in this county with 604.5 lbs. milk and 30.65 lbs. fat and is still going a 30-lb. gait 2 weeks after test. Out of the 24 herds tested, 9 unprofitable cows were sold. Milk conditions are fair in this community, the average price for 4 per cent being $2.70. Butter sells for 55c per pound. Feed prices are slowly coming down. Corn and cob meal sells at $24 per ton; bran, $34; oats, $36; oil meal, $50; cottonseed meal, $45; dried brewers grains, $44; hay, $18.

North Branch, Pennsylvania:—Six unprofitable cows were sold. One pure-bred Holstein bull was purchased. The ten high fat cows of the association were owned by six men. They were all Holsteins except one and averaged 1,400.28 lbs. milk. 50.317 lbs. fat. Three per cent milk sold for $3.38 per cwt. Milk retailed for 12c per quart; butter for 50c per pound; cheese, 30c. Mixed hay sold for $18 per ton; corn silage, $6; corn stover, $8; root crops, $8; ground oats, $29; corn and cob meal, $24; linseed meal, $51; cottonseed meal, $42.50.

Eatonville, Washington:—April 30 marked the end of the sixth month of this association's work. At present there are thirteen members and a total of about 150 cows are tested each month. The winners for the month of April are George Nelson, first, for the best individual cow, a grade Jersey, (59.52 lbs. fat) and John Malm, second, a pure-bred Holstein, on 51.61 lbs. fat.

Arkansas, Wisconsin:—Five boarder cows were sold and one pure-bred Guernsey bull bought for breeding. Clover hay is most all killed out and some farmers are sowing oats and peas for hay. During April market milk sold for $2.10 per cwt. The creamery paid 47c per pound for fat and the cheese factory, 42c. Butter retailed for 42c per pound and cheese for 25c. Oats sold for $20 per ton; barley, $26; corn, $26; bran, $22; oil meal, $46; gluten, $34.

Write me for further information.

RALPH TRATT, Whitewater, Wis.

Cows and Wheat in Kansas

HOARD'S DAIRYMAN:—The dairy cow is gradually driving back the Kansas wheat fields. One of the best evidences of this was displayed recently when hundreds of people attended Reno County's first dairy show consisting of 104 fine dairy cattle exhibited by dozens of breeders who live in the heart of the Kansas wheat belt. J. B. Fitch, head of the Kansas State Agricultural College dairy department, predicted that in a few decades, Hutchinson, now a grain and milling center in the state, would be known as a dairy center. To support his prediction Professor Fitch pointed to high school classes in agriculture, from five western Kansas towns, attending the show in order to study dairy cattle types.

All the cattle exhibited were registered stock, bred by farmers who began their herds not many years ago in a small way. Many started with a few cows imported from other states. "From the offspring of those few cows the golden color of Kansas wheat fields is becoming spotted with the color of the Jersey and of the Holstein," said one of the exhibitors. "And our farmers will be able to live in better homes when that is done. I know that was the case with me."

Kansas. D. STALLARD.

Rob Roy Farm Ayrshires

Auchenbrain White Beauty's Good Gift

AUCHENBRAIN WHITE BEAUTY 2D

Having sold my farm, I will sell at private sale my entire herd of Ayrshires consisting of 33 head and including White Beauty's Good Gift, 18057, the only living son of the world's champion Auchenbrain White Beauty 2d, the greatest Ayrshire cow living, whose sire was Imp. Kate's Good Gift, 15426, and whose dam was Imp. Auchenbrain Brown Kate 4th with a milk record of 23,022 lbs. and a butter record of 1,080 lbs. This bull shows the vigor and elasticity of a two-year-old, has a good disposition and is a sure and quick stock getter. He is guaranteed absolutely free from tuberculosis, having passed three successful tests within the past year. With him are 20 of his daughters, ranging from three months to three years old, and 4 of his sons, ranging from three months to a year old, all of the choicest breeding and many from A. R. O. dams. Herd free from tuberculosis and contagious abortion and will be sold subject to Federal test if so desired. Here is the chance of a lifetime. Come and see them and get your first choice. I must sell.

J. W. MUDGETT, **Ellicottville, New York**

MIDDLESEX MEADOWS FARM

OFFERS

Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.

Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we **KNOW** you can't get as good as these two for any less money elsewhere.

SEWICKLEY, PENNSYLVANIA

Community Breeders' Clubs

(Continued from page 818)

two-thirds vote of the members present at any regularly called meeting of the Executive Board.

A number of counties are now organizing or reorganizing breeders' associations using the Community Club plan. The Barron County Holstein breeders adopted the new plan on February 25. The Guernsey Breeders' Association of the same county is also reorganized under the plan. There are at present nine community clubs in the Holstein and also nine in the Guernsey Associations in Barron County. The membership has been increased in each association fourfold. New interest has been aroused and each club is imbued with a spirit of doing a definite piece of work.

The Cumberland Club of Barron County conducted a sale of young pure-bred bulls on February 26th, selling sixteen fine young animals. Eight of these went to replace scrub sires in the surrounding territory. The Guernsey Club of Turtle Lake, Barron County, is pushing a cow testing association and will soon have the same in operation. The Nasonville Club of Wood County has outlined its plans for the year 1921. The club has sixteen members. Each member proposes to secure one new member.

Each club member pledges to secure at least one pure-bred female this year. The club proposes to promote calf clubs for boys and girls, also a cow testing association and a drive against the scrub sire. And so we might go on and enumerate the activities of local clubs. Many single activities of a local club are equal to a similar activity on the part of the whole old association. Yet in a county we may have from six to ten or twelve clubs each capable of equal accomplishment.

The following plans and activities have been enumerated for the local clubs:

1. A complete sales organization, composed of the leader and secretary in each community whose business it would be to know of surplus stock, and who it is presumed would be paid for knowing. This should be a definite commission for sales arranged. This plan would help to move bulls to where they belonged. This organization could work through the secretary of the county executive board and the county agent's office especially on deals outside of the county.

2. The annual meeting of the association could be held in a different community each year and be connected up, perhaps, with a local fair, the meeting presumably to be held in the summer. This would insure a large attendance.

3. Community fairs could be held at which time the best stock could be selected to be sent on to the county fair and farther still if warranted. Community sales could also be held at the same time.

4. Special meetings and demonstrations including stock judging could be held by the community club, perhaps on the best farms. This would lead to greater progress as a result of the exchange of experiences, etc. Winter meetings of this character as well as summer could be held.

5. The meetings of the executive board will be well attended by the various leaders. These men would feel responsible to their local associations for the action of the executive board and would thus feel more of an obligation to attend meetings than is true under the present arrangement.

When writing advertisers please mention Hoard's Dairyman.

A Carload of Exceptional Producers
GRADE OR PURE-BRED HOLSTEINS.

We recently purchased a large number of grade and pure-bred cows thrown on the market by the unsettled condition of the milk market in this section. They are large typy animals, due this spring, tuberculin tested and just the kind we like to get. Will average close to 10,000 lbs. a year. If you need such cows, write at once.

Also grade heifer calves, pure-bred cows, heifers and bulls of all ages.

Every Sale Means a Completely Satisfied Customer.

RIVER MEADOW FARMS, Portlandville, N. Y.

Accredited Holstein Sale — Austinburg Ohio June 6th

At the farm of Chas. Whiting, one-half mile north of Austinburg.

55 HEAD COWS AND BRED HEIFERS 55
ALL FROM ACCREDITED HERDS

CHAS. WHITING, AUSTINBURG, BECAUSE of the death of his son, will sell his entire milking herd of 19 cows including Majella Maid Korndyke with 28.20 lbs. butter, 510.9 lbs. milk in 7 days, and her excellent three-year-old daughter, both bred to a 29.46-lb. grandson of King of the Pontiacs. Also several other relatives to this great cow. Only four of these cows have reached mature age, the remainder being 2 to 4 years of age. Also a yearling bull out of the 28.20-lb. cow.

DR. H. O. FREDERICK, ASHTABULA, OHIO, will sell 12 excellent cows and heifers all bred to Daisy Hill Pontiac Fries, a son of King of the Pontiac's son (out of Pauline of Brightview with 1119.91 lbs. butter. 25,606 lbs. milk 365 days) and out of Lady De Kol Fries 2d, who has just made 29.46 lbs. butter 7 days and is on yearly test.

E. D. HUMPHREY & SON, GENEVA, will sell 13 cows and 7 bred heifers. These cows are all 2- and 3-year-olds, all milking and part of them will be bred at sale time. The heifers are all bred for fall freshening.

Besides this excellent lot of cattle, Mr. Whiting will offer for sale his 92-acre farm, all under plow, with good house, excellent barn, steel stanchions for 38 cows, silo and an ideal location for a modern dairy. Every animal from an accredited herd. Every animal guaranteed a breeder. Will accept bankable notes, six to nine months' time at 7%.

Buyers will be met by auto at Hotel Ashtabula, Ashtabula, Ohio.

RIVERSIDE TIRES are NOT Seconds. They are clean, factory firsts of the highest quality—guaranteed by us to be made as good as tires can be made.

Each tire has our trade-marked name—"Riverside." And the name "Riverside" stamped on a tire is as good as the name "Montgomery Ward & Co." written on a check.

An Absolute Guarantee
By Montgomery Ward & Co.

We do not believe there is any firm from whom you buy tires that has an equally old, time-tried Guarantee of "Satisfaction or Your Money Back."

For over forty-nine years, Ward's has sold everything on a Guarantee basis. Millions of customers in that forty-nine years have bought hundreds of millions of dollars' worth of merchandise under that Guarantee.

So, no thinking person can have any doubt, any hesitancy ordering a Ward's Riverside Tire—with the full knowledge that our forty-nine-year-old reputation will be lived up to absolutely.

We guarantee Ward's Riverside Fabric Tires for 6,000 miles. We mean exactly that.

We guarantee Ward's Riverside Cord Tires for 10,000 miles. We mean exactly that.

There can be no risk whatsoever in your ordering a tire from Montgomery Ward & Co. We know that the prices we quote are very low. But the saving we offer is a real saving on the finest grade of clean factory firsts.

Save One-Third on YOUR Tires, TOO!

Read what we say here about prices: "The Plain Truth about these Low Prices"—and then send your order now.

With an absolute guarantee, backed by a house of unquestioned reliability—Why not at least try Ward's Riverside Tires? Why not save one-third on YOUR tires, too!

The Plain Truth
about these Low Prices

First let us say that we believe you will ***never again buy tires at such low prices***—unless there is some great discovery of a new way of making tires.

Just consider that before the war, rubber was 60 cents per pound and formerly it was $1.10 per pound. During the war, rubber actually went down to 50 cents per pound.

Last spring the tire business was demoralized. Rubber went to 18 cents per pound. Cotton broke from 40 cents per pound to 12 cents. It is said that 40,000 people moved away from Akron—the great tire making city.

And there, with everything at the low mark, was the opportunity we are always looking for. with cash in hand, to secure a saving for our customers.

With some great change in making tires—some discovery—you may some time in the years to come buy tires cheaper. But otherwise, Ward's prices in this Summer Sale will be the lowest prices at which you ever bought standard, high grade, guaranteed factory firsts.

Do You Own a Buick, Packard, Cadillac, or Hudson?

We quote here our great Mid-Summer Sale Price on a 30 x 3½ tire for Overlands, Fords, Maxwells, Dorts, Chevrolets, etc.

But you who own Buicks, Packards and other cars, write for the book below, our July-August Sale Book. It offers you a saving of one-third on all sizes of Fabric Tires—and on Ward's Riverside Cord Tires—guaranteed for 10,000 Miles.

MONTGOMERY WARD & CO.

Chicago Fort Worth Kansas City St. Paul Portland, Ore.

This Great Sale Book is YOURS—FREE!

Ward's Great July-August Sale Book is ready. It quotes Ward's low prices on all sizes of tires—offering a saving of one-third. On tubes and many other automobile needs the saving is very large. But there are all kinds of merchandise in this great reduced price sale. Wearing apparel for women, men and children; woolens and silks and cotton goods at startling prices. Everything for the home, for the farm.

We have tried to make this book a complete offering of your Mid-Summer needs—at wonderfully low prices.

One book is Yours—FREE! Fill out now, this coupon, and send it to the one of our five houses that is nearest you.

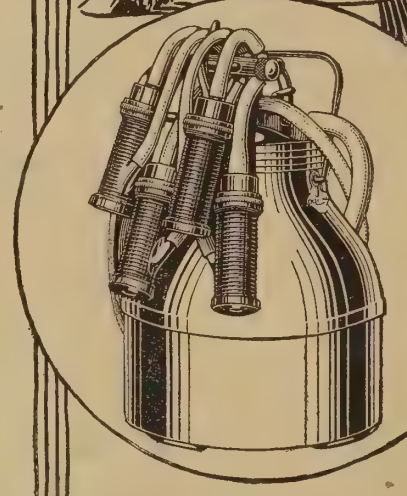
HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING



No More Reason why You Should Milk by Hand than Harvest by Hand

The De Laval Milker

saves more time during a year than a grain binder or any other labor-saving device a dairyman can own. In addition it increases the production of milk, many De Laval users say, to such an extent that the increased flow alone pays for the milker.

EASY TERMS can be arranged so that you can use the De Laval Milker while it pays for itself. Send for complete information.

A Better Way of Milking

The De Laval Separator Company

NEW YORK	CHICAGO	SAN FRANCISCO

Plan of Milk Marketing Organization

C. LARSEN, ILLINOIS

NO one plan of milk marketing organization can be applied in all details everywhere. Conditions vary and the relative importance of the purposes to be accomplished will vary.

General Organization Plan

Viewing the general organization plan as a whole and as now practiced and endorsed by the Illinois Agricultural Association, it may be classed under three main heads.

First, organization of the milk producing territory tributary to the milk supply of large cities.

Second, organization of the districts supplying milk for cities of about fifty thousand inhabitants or less.

Third, organization of the milk producing territory more scattered and more suited to creameries, cheeseries, and small condenseries.

Organization for Large Cities

In the larger cities there are already well established, well financed, and well equipped companies for the distribution of milk to the consumers. In these cities it is not considered a good plan for the co-operative milk marketing companies, for the present at least, to attempt to distribute the milk.

The milk producers organize chiefly, first, to handle and manufacture the surplus milk more economically than can the distributors; second, to supply a uniform supply of fresh milk of high quality for the distributors and thus prevent old milk from being delivered to the consumers; third, to strengthen their selling or bargaining position; fourth, to insure a dependable and stable milk market; fifth, to prevent difficulties so likely to arise in the many transactions between producer and consumer; and sixth, to be in a position to give the best publicity possible to milk as a food and encourage increased consumption.

How far a milk marketing organization of a large city should extend its activities out into the milk producing field is a question. In most instances in the Central West, the special market milk producing territory ceases at about one hundred miles from the city. In such places it is reasonably clear that the marketing association should include the whole territory under one management.

In other cases the milk producing territory is continuous for several hundred miles in several directions from the city. Though the milk in the out-lying territory may not have been used for the city supply it is nevertheless present in right quality and quantity to be used for city purposes. In such instances, it appears that separate local organizations in the outlying milk producing territory, or separate pools under the same general management, will serve the milk producers better than will a continuous branching out or extension of the one marketing organization. In other words, there is a limit to which one organization can spread and still serve its membership co-operatively and satisfactorily.

Organizations for Smaller Cities

The second field includes the territory near the cities having a population of about fifty thousand and less. Some of these cities have poor milk distributing systems. The milk producers usually do a considerable part of it themselves. Some of these cities have no milk ordinances, and, if they have them, little attention is given to their enforcement. In cities of this size, there is a great opportunity to improve the quality of market milk through businesslike methods of distribution.

The conditions of the milk supply largely determine whether the co-operative milk marketing company should sell to dealers only, or whether it should do the distributing also. In one city in Illinois, having a population of about twenty thousand, a co-operative milk marketing company was organized. The milk distribution was already in good hands and the distributors were willing to co-operate with the organized milk producers. In another city of about thirty-seven thousand inhabitants, milk producers and many small milk venders were in the business of distributing milk. Here it was thought best that the milk producers should do the distributing also.

Scattered Milk Territory

The third territory comprises the milk producers who are interested in general farming. It may include territories producing milk for condensed milk plants, cheeseries, creameries, and cream shipping stations. In order that the whole dairy industry may market intelligently it is important that this field be organized also.

This territory should be organized to help the milk producers, and not for the primary purpose of keeping that milk away from the larger cities. We must not lose sight of the fact that the price of milk is influenced by several factors, such as: Value of butter, cheese, condensed milk, and other dairy products; competition of milk with other food products at given prices; cost of producing milk; cost of distributing milk; buying power of the dealers, and selling power of the producers. All of these factors will continuously influence the price of milk and therefore should be carefully considered in the orderly and systematic marketing of all milk, no matter in what territory it is produced.

CHICAGO CITIZENS WHO BELIEVE IN MILK

The Kozminski school held the record last year for the largest percentage of underweight children. To correct this condition the Parent-Teacher Association has arranged for a daily supply of milk to the school. The four children pictured here seem to favor the arrangement.

State Sales Organization

Eventually it is hoped that these various co-operative dairy marketing organizations may form a state sales organization. These various co-operative organizations should manufacture products of better quality than does the average plant at the present time. This high quality and dependable supply should create outlets at good prices.

Specific Plans of Organization

In the organization of a co-operative milk marketing association at least five factors are considered fundamental.

Co-operative From Beginning to End

First, the milk marketing company should be completely co-operative. There should be a distinct need in the community for such an organization. The milk producers should be interested. They should feel that they are a part of the organization. If they do not, the marketing company will not have maximum success. The future success of the milk marketing company must be measured by the intelligent and interested shareholders and not by the indifferent and unintelligent members. The more co-operative and the more representative a marketing organization is made the more complete will be the interest of its members and the more strength the organization will have.

Under the co-operative law of Illinois it is possible for a few men with little capital to organize a co-operative marketing company, elect their officers, and shape the policies, and then proceed to secure the membership of the mass of milk producers. In this manner a ring of self-appointed leaders can head the organization, but they probably will not succeed well in holding a big marketing association together. Our plan is to sell shares to as many as possible and then call a meeting of all of the subscribers to elect a board of directors and approve by-laws and policies. In this manner the organization is made more representative and the milk producers are more likely to become really interested and remain interested and loyal.

Further, the co-operative plan provides for one pool and the same price to all at a central market for like grades and quality. It is in this connection that most difficulties in co-operative milk marketing arise. We believe the principle of one price and one pool in one organization is correct, difference in transportation considered. However, local conditions may necessitate a partial deviation.

Provide Ample Finances

Second, it is important to plan for ample finances. Make capitalization plenty large the first time. The stock which cannot be sold may be held as treasury stock and sold later. A successful marketing organization will expand. The capitalization should not be less than $1 per pound of milk to be handled daily. Further, we believe that the par value of each share of stock should not be less than $100. It is true there are small producers who feel they cannot afford to invest that much. Such milk producers must either stay out of the marketing company or invest the $100. It may be said that if the value of each share is $25 or $50, then practically all of the smaller milk producers will subscribe for at least one share and the larger milk producers can take several shares. In practice it does not seem to work out that way. Most milk producers, whether they are able or not, will take only one share. If

Alta Crest—A New England Farm Rejuvenated

THERE'S a pull to Alta Crest. You leave wishing you could stay and are glad when fortune permits your return. There is inspiration in this big successful agricultural enterprise, where the desire for profit has not prevented the development of all that is beautiful and artistic in rural New England and yet where a practical, sane management coaxes satisfying returns from a none too willing soil.

If it is true that "God made the country and man made the town" it must be admitted that until A. H. Sagendorph bought Alta Crest Farms, the Deity had left many things undone, if these 1250 acres were ever intended for agricultural use. Reclaimed from the "rock-bound" fields of Massachusetts, Alta Crest stands out in bold relief in typical New England surroundings as an example of what brains and a vision can bring about.

A day is quickly spent at Alta Crest. The new barn, replacing one destroyed by fire in 1918, claims much time from one who appreciates the best in dairy structures. It is attractive in design, practical, unusual in plan but suited to its purpose, well ventilated, and windowed for maximum sunlight. The upper part, shown to the right in the illustration, has 26 stanchions and 8 box stalls, and the lower part, 19 stanchions and 6 box stalls. It has fire proof hay space, ample silage storage, and plenty of room for concentrates. A second barn constructed some years ago supplements it in housing the herd.

Fields Reclaimed

If a visitor is first of all a lover of the soil he finds delight in the broad expanse of fertile, productive fields—where a straight furrow well over a mile long can be turned. Here midwest operations are carried on by power farming, when the fields on all sides are yet "half and half", being about equally divided between stones and soil. One interested in the Eastern States Exposition idea of the rejuvenation of New England agriculture must find courage and comfort here for the New England farm offers more satisfying studies to one who understands the difficulties overcome. Alta Crest is demonstrated proof that abandoned farms can be brought back into the fold of profit makers. If "the eye of the master fatteneth his cattle," Alta Crest is an example of the eye of the master fattening a whole landscape. For out of rocky, unproductive fields so full of stones and tribulation that the purchase price of the first 160 acres was only $2,200, and, of the next 420 acres, $8 an acre, has come one of the best farms in all New England. Where the chief crop was formerly material for stone fences and roads, land now produces three tons of hay, and oats and silage corn in proportion.

Fame From Ayrshires

Alta Crest is chiefly famous for its Ayrshires. Nowhere else on the farm has Mr. Sagendorph succeeded so well in combining the artistic with profitable utility, notwithstanding the fact that the new stable itself is difficult to surpass in this respect.

This farm has long rendered the breed a great service. Its pictures, its advertising, and its show herd have given many a present owner his first interest in the breed. Alta Crest Ayrshires have individuality—a clean-cut, fixed character not soon forgotten. They have come to mean something definite in the way of type. But the dairy farmer demands more than perfection of conformation—the "proof of the pudding" in a dairy herd is a record of production. The breed has needed nothing else so much as a convincing demonstration that the two—milk flow and beautiful lines—can go together.

The American dairy farmer has long stood by the show ringside and admired the Ayrshire. Her beauty of type attracts every lover of perfection in animal form. But the dairy farmer must be, first of all, practical. He desires beauty in his herds but cannot afford it at the expense of net profits. So far as the Ayrshire goes there are many, many Missourians among farmers—yet to be shown. They have admired the red and white cow and wished for her superior breed qualities in their own herds but turned away with the expression, "A beautiful cow, but —". They have demanded proof that this cow of finished form could milk. Creditable records were published for the breed but they were not made in many instances by the cows the dairy farmer saw in the ring. They lacked the many little perfections which characterize Ayrshire show type.

"Proof of the Pudding"

Until July 8, 1920, no cow at Alta Crest had been milked more than twice a day though private records show productions as high as 60 pounds. To that date no Advanced Registry records had been started. From July 8, last, cows have been put on test as they freshened. In their consistent production Alta Crest now furnishes a "convincing demonstration" of a successful combination of form and function. In April, 1921, thirty-three cows, according to the test supervisor's data, were milking 45.5 lbs. Several of these are well toward the end of their records and twelve are two-year-olds. A thirteen-year-old in her first six months has made 10,259 lbs. milk, 428.48 lbs. fat. Is there need for better proof that "cows with type will milk"? A thirteen-year-old promises to set a new breed record, two-year-olds hit above the 50-pound mark, ten daughters of that age by one sire averaging 47 lbs. A seventeen-year-old cow in half a year has exceeded the record for that age and gives promise of keeping at it.

The breed's characteristic of longevity is well illustrated at Alta Crest. When the cows in most herds are long since gone, these Ayrshires are yet in their prime, producing bountifully and dropping calves which reproduce their dams' merits at maturity. Thirteen-year-olds milk like young cows; a seventeen-year-old came out of the barn, when these notes were taken, with the vigor and sureness of a two-year-old and, posed with the stable as a background, stood without fault of conformation or apparent evidences of her years. At least twenty cows in the herd are thirteen years or more. These old foundation matrons, from which the fifty-pound two-year-olds are descended, have every mark of production. They have the appearance of milkers—long bodied, strong-chested, deep middled cows with the faultless udders which make the Ayrshire an Ayrshire.

The Foundation

The first Ayrshires came to Alta Crest in 1909. Among the great cows secured the greatest was Castlemain's Violet, "The finest cow," says Mr. Sagendorph, "I have ever laid my eyes on." In 1913 an importation of 26 head was brought from Scotland. Descendants of these and of animals brought from Canada make up the major part of the present herd. The breeding operations of the farm have centered about the son of Castlemain's Violet, Alta Crest Wheel of Fortune, who now has forty daughters in the herd. Castlemain's Violet was by Netherton Millwheel by Castlemain's Wheel of Fortune out of Castlemain's Sweet Marie, the dam of Castlemain's Violet—a pretty piece of line breeding.

In service now are Lessnessock Searchlight, first prize two-year-old at the 1920 National and by Casabianca, and Alta Crest Ace out of a foundation cow and by Alta Crest Gold Coin by Alta Crest Wheel of Fortune. The senior herd sire is Morton Main's Lord

AYRSHIRE ASSOCIATION ACTIVITIES

Remarks of A. Henry Higginson before the 46th Annual Meeting of the Ayrshire Breeders' Association at Springfield, Massachussetts, June 8th

IT gives me great pleasure to welcome you all here at our 46th annual meeting. I hope our members from the West do not mind visiting us again this year; I had hoped that our annual meeting would be in the West. As you know the executive committee of the Association planned to hold the meeting and sale in Milwaukee this year, but our western members felt that the time was not propitious for holding a sale in the West and felt—and I think rightly—that the meeting and sale should go hand in hand. I sincerely hope, however, that before another year has rolled by times will have changed for the better, and conditions will be so much improved that we can hold our meeting and sale at some point more easily accessible to those who live in the West, whose interest in the Ayrshire cow has meant so much for her advancement. I feel sure that Easteners will all be glad to come west, and I know that we shall be received with the same hearty welcome which we have always tried to extend to our western fellow breeders here. That the breed will benefit much by the change I am sure. None of us can afford to be selfish—we have a great breed, and we must be willing to share it.

It has been in many ways rather a hard year for breeders of all kinds of pure-bred live stock, dairy cattle, beef cattle, sheep, and swine, and the interests of the breeders of Ayrshire cattle have suffered with the rest. Though the price of feed has dropped and to a certain extent the price of labor with it, the cattle market has been very bad and it has been hard to obtain good prices, even for the best of stock. The almost impossible rate of exchange with all South American countries has put a stop to all exportation of animals to that part of the world and prospective buyers have taken their orders elsewhere. Were it not for that fact I think the Ayrshire cow would have gotten a good start there, and, even with conditions as they are, the interest evinced by South American buyers leads me to believe that as soon as the rates change there will be a good demand for good Ayrshires in excess of the supply.

But if trade with South America has been temporarily held up, trade with those parts of the Northwest hitherto undeveloped along dairy lines has been steadily on the increase—and I predict that with the National Dairy Show held in Minneapolis this fall there will be a good demand for our cattle within the year. But you must not forget that in order that the dairymen of the Northwest should want our cattle they must be made to realize what a great breed we have, and we must leave no stone unturned to demonstrate its good qualities.

This brings me to the most serious part of my message to you. During the year that I have had the honor to be your president, it has been my constant endeavor to try to find out in what way I could best help our breed. I have been to a good many fairs and sales during the last year, done a good deal of listening, and very little talking. Little by little I've been forced to a conclusion which I am very loath to accept, but which is I feel nevertheless true, that, instead of being at the head of the procession where she rightfully belongs, the Ayrshire cow is to-day at the tail-end of the four great dairy breeds. She has come to be regarded by many as "the rich man's cow" to be looked at admiringly by visitors on Sundays, not as the commercial cow that we've tried to make her. It is not true, of course, but that is the opinion of many men who do not know, men who are about to embark in the dairy industry and who, after hearing this criticism, start in with another breed. I think I know what has caused this—and I think I know the remedy, but we must resort to it at once if we wish to put the Ayrshire at the head of the procession instead of where she is to-day.

The trouble is that we have thought too much about show ring type, about show winnings, and too little about production. Show ring type is all very well, and must not be lost sight of, but a cow is made to produce milk, not to look at. As long as we give prizes in the show ring to good looking cows without milk records, or without proper milk production in their pedigrees, we are going to continue standing still, and it will not be long before we begin to slip backwards. What is the use of buying a cow that will not make at least 10,000 lbs. of 4 per cent milk? She will not pay her way these days and she will breed the kind of calves we don't want. We send a sales committee to examine into the show ring conformation of cattle for our National Sale—but how often does one hear the question asked, "How good is her record?" There is just one way to safeguard the whole situation and that is the adoption of a dual standard for the show ring, a standard which shall give so much credit to the proven production of an animal or of its immediate ancestors in the case of males and immature females, that a cow with no production stands no chance. None of us would want to see an ugly, misshapen cow win a class. Why should we not feel the same way about a cow that couldn't come up to at least the Advanced Registry requirements? Our brothers across the water in Scotland have realized that animals that have good records must be given credit for what they have done, and it is high time that some such rule is put through in this country. Let us have show ring conformation by all means, let us show our animals, but let us lay more stress on production in the future than we have in the past.

This has been a year full of occurrences which may mean a great deal in the future of the breed, and when you have read the report of Mr. Sagendorph who has acted as chairman of your executive committee during a great part of the year, and who has brought the Ayrshire Digest (formerly the Ayrshire Quarterly) to its present state of perfection, admitted by everyone to be the best of all the breed publications, I think you will feel that something worth-while has been accomplished. But the weather hasn't been clear all the time—there have been clouds in the sky, which at one time looked pretty serious, but which I am happy to say have now I think cleared away for good, and, as "every cloud has its silver lining", I predict a very happy and prosperous year for the beginning twelve months.

In laying down my duties as president, I want to thank all those who have helped me during the year by their co-operation and support, to thank in particular the members of the board of directors who have stood by me so loyally in time of need. I wish to say to the man whom you may choose as my successor that he is very fortunate in having such a set of men to work with,

WINNERS AT THE HIGHLAND AGRICULTURAL SOCIETY AYRSHIRE SHOW AT AYR, SCOTLAND, WHERE PRODUCTION WAS CONSIDERED IN MAKING AWARDS

Above, group of cows, each a first prize winner in her class; center, Hobsland Lucky Boy, champion bull, owned by Thomas Barr; below, left, Hobsland Nancy 6th, first prize four-year-old cow in milk and champion, owned by Thomas Barr; and Dunlop Fulmmery, first prize two-year-old, owned by Mrs. E. L. Houison—Crawford.

In placing the animals form, symmetry, and constitution were given 30 points; mammary development, 35 points; and authenticated milk yield in the case of a cow, 35 points; or authenticated milking pedigree in the case of bulls or heifers, 35 points. In allowing points on production a minimum and maximum were fixed. The minimums for a heifer and cow are 500 gallons and 650 gallons respectively, with a maximum of 850 gallons of milk in a year for a heifer and 1000 gallons in the case of a cow, the butterfat requirement being 3.8 per cent. One point was allowed for every 10 gallons in excess of the minimum requirement.

Much controversy has occurred in Scotland between two factions of breeders, one holding out for the old tight-vesselled, short-teated show type common in America a generation ago, and the other for the larger, more rugged cow of heavy milking qualities. In the Ayr show this year the latter group of breeders put their ideas of show ring requirements into use. Not all breeders were pleased with the results of selections by the new system but the general feeling was one of satisfaction. It is expected that some changes will be made but that the general scheme of giving credit for production will be continued.

Students' Stock Show

E. G. WOODWARD, State College of Washington

COMPETITION always adds zest to an undertaking. For that reason the annual Live Stock Show and Mock Sale held by the students of the College of Agriculture in the State College of Washington has shown itself of material benefit in supplementing classroom instruction. This year's show and sale was a decided improvement over the event as held in previous years. Exactly forty head of dairy animals were fitted and shown by the students, as well as about thirty-five head of fat stock and horses.

All of the work in fitting and training these animals for the show was done outside of classroom hours, and there is no doubt but that the stock successfully taught a good many things to the students which the instructors had vainly tried to teach in the classroom. Many of the students spent as much as two hours a day for two or three weeks in fitting and training their animals, so that the show, when finally staged, compared favorably in many respects with the live stock exhibitions to be seen at some of the fairs.

The program for the day included a judging contest early in the forenoon followed by a contest in showmanship during which time the contestants were subjected to the most rigorous sort of an examination in showmanship by Judge H. C. Davis of Washington. In the afternoon, the Mock Sale was held, in which fourteen head of fat stock and horses were disposed of. It is perhaps fortunate that no money changed hands, else some fathers in the state of Washington would have issued hurry calls for their sons to return home, and the State College would have suffered a heavy loss of students.

All animals were appraised by committees of prominent breeders as they came into the sale ring. The only information the appraising committees had regarding the animals was in the catalog of the day, so students and committees worked on the same basis.

The students recorded their bids on cards printed for the purpose, each being required to enter a bid on each animal passing through the sale. In awarding the prizes for bidding the difference between the appraised valuation and the students' bid was calculated and the man with the lowest total difference was awarded the prize.

It is notable that the most prominent dairy cattle breeders of the state took an active interest in this event, either by attending in person or by offering prizes.

Prizes were offered in each of the three breeds represented: Ayrshires, Holsteins, and Jerseys for showmanship, bidding, and fitting. The fitting prizes were awarded by a committee who went over the animals about six weeks previous to the show at the time the students selected the animals they were to fit. This same committee examined the animals again on the day of the show, and awarded the prizes to those students who had made the greatest improvement in their animals.

Ed. Kellaway, Idaho, and Chinook Cavalier Carrie with which he won the H. C. Davis sweepstakes trophy for showmanship.

Following is a list of the awards:

Fitting: Jersey, trophy offered by Waikiki Farm, awarded to R. W. Holt; Holsteins, trophy offered by Hollywood Farm, and awarded to C. N. Carlsen; Ayrshire, trophy offered by E. W. Van Tassell, and awarded to Miss Adah Proctor.

Showmanship: Jersey, trophy offered by Cyrus Gates, and awarded to Edward Roberson; Holstein, five dollars cash, offered by Hollywood Farm and awarded to C. E. Egbert; Ayrshire, blanket offered by R. Laacke Manufacturing Co., Wisconsin, and awarded to Ed. Kellaway.

The sweepstakes trophy offered by H. C. Davis was awarded to Ed. Kellaway.

Bidding: Jersey, trophy offered by David McLeod and awarded to Jack Plaskett; Holstein, trophy offered by Carnation Stock Farm and awarded to Marvin D. Gross; Ayrshire, trophy offered by Carnation Milk Products Co. and awarded to E. W. Farr.

Preparing their animals for the show. These students worked one to three hours a day for two or three weeks in fitting their heifers. Both students and calves are benefitted by the experience.

General view of the Holstein line-up. There were nineteen entries in this class. The third cow from the end is Mapleview Myra De Kol 2d, first prize winner at the Pacific International last fall.

Sunflower Silage Experience in Northern Michigan

D. L. McMILLAN, MICHIGAN

IN the summer of 1919, we planted one acre with an ordinary grain drill, sowing 10 pounds of Mammoth Russian sunflower seed to the acre in rows 24 inches apart. This was cut when it was about one-third in bloom, put into a silo, and fed out to the herd. The cows seemed to relish the silage, and we could see no difference, practically, in the milk production than when fed pea and oat silage. We were so well satisfied with the sunflower as a silage crop that we put in 7½ acres in the summer of 1920. This was seeded May 29th, in rows 32 inches apart, 9¼ lbs. of seed to the acre. This gave us too thick a stand, so we went through with hoes, and blocked the plants so that they were from 6 to 10 inches apart. The field received three cultivations, and at that time were so large that they spread out until the leaves touched one another between the rows.

As we had no corn harvesting binder to cut the crop, we made a V-shaped sled with cutting knives on each side, so as to cut two rows at a time. These knives were old cross-cut saws, sharpened on the back, and bolted to the sled. The field was cut when approximately one-half the plants were in bloom. The sunflowers lay on the ground for one-half a day after cutting to allow part of the moisture to evaporate, then were hauled to the silo, each load being weighed as it was brought from the field. The yield was 24.6 tons per acre. There was no more difficulty in running the sunflowers through the silo filler than there would be with corn. When one-half of the silo was filled, eleven tons of peas and oats were cut in, the balance being filled with sunflowers.

This silage made last fall was fed to the dairy herd and the sheep. Careful records were kept of the milk production and observations were made regarding the palatability and the general health conditions of the animals on the two kinds of silage. The same grain ration was fed during the time we were feeding sunflower and the pea and oat silage. The change from sunflower to pea and oats silage was made on Jan. 17, and back to sunflowers on Feb. 13. The average daily milk production for the last 15 days before changing from sunflower to pea and oats silage was 484.6 lbs. The average for the 27 days while feeding pea and oats silage was 483.8 lbs. The average daily milk production for the 15 days after making the change back to sunflowers was 466.2 lbs.

The cows relished both types of silage about equally well, but owing to the more bulkiness of the pea and oats, they did not consume more than 35 lbs. per head per day, while they would take 40 lbs. of the sunflower silage. This comparative test would indicate that, pound for pound, the peas and oats silage was a little better than the sunflower silage, but was about equal in palatability and ability to produce milk when the animal was allowed to consume the amount desired. From the standpoint of economy, the sunflower silage has the advantage, as it can be produced for about one-half the cost of the pea and oat silage. The reduced production in the last quotation is due, somewhat, to a more advanced stage of lactation.

SLED USED FOR CUTTING SUNFLOWERS AT THE UPPER PENINSULA STATION OF THE MICHIGAN AGRICULTURAL COLLEGE

Our crops experimenter, Mr. G. W. Putnam, is experimenting with the crop to determine the amount of seed and distance between the rows that will produce the greatest amount of tonnage of the best quality of forage for silage purposes. His last year's test would indicate that rows from 30 to 36 inches apart, seeded from 6 to 8 lbs. per acre, will give the most satisfactory results under our conditions. This work will be continued for at least three years before sufficient data can be secured to publish definite results.

Considerable experimental work must be done to determine at what stage of development the sunflower plant will give the greatest feeding value. The objection to letting the plant get too nearly matured is that rosin develops in the plant during the last stages of development, which produces a dark colored, ill-smelling, and somewhat unpalatable silage, and there is also more crude fibre. The

American Farm Bureau Notes

Ohio joins the 100 per cent farm bureau column. Every one of the 88 counties in the Buckeye State has voted affiliation with the Ohio Farm Bureau Federation. The other 100 per cent farm bureau states are Iowa, Indiana, New Hampshire, and Delaware.

Indiana Federation's New Secretary

Perry Crane has been appointed secretary of the Indiana Federation of Farmers' Association to succeed Maurice Douglas, who resigned when appointed by Governor Warren T. McCray to serve as a member of the Public Utilities Commission of Indiana. Mr. Crane is a dairy farmer at West Lebanon, Ind., and a well known breeder of Guernsey cattle. He will assume charge of the Indiana secretary's office July 1st.

"The Truth-in-Fabric Bill, providing for compulsory branding of cloth as to content, is again up in Congress, and hearings upon this bill began June 1st."

Organization Progress

North Dakota is launching membership drives in Richland, Ranson, and Renville Counties. Lincoln and Polk Counties in North Carolina have been added to the Farm Bureau list, and Guilford County has finished its drive. Arkansas reports new farm bureaus in Desha, Lincoln, Dallas, Lonoke, and Poinsett Counties. Lauderdale County Ala., has completed a farm bureau. Wisconsin is preparing for membership drives in a dozen counties in the southwestern part of the state.

The Farmer Pays the Freight

A representative of the transportation department of the American Farm Bureau Federation appeared at the Interstate Commerce Commission's hearing in Denver on May 19 and presented the following statement:

"The prices of farm products are set by competitive conditions. The price of farm products is fixed at the market, and not at the farm itself. The farmer receives the market price less the freight. The manufacturer adds the freight to his cost of production. It is because the farmer must so pay the freight in every case that the increase in freight rates affected the agricultural interests of the nation so seriously. When you add to this increase in the marketing costs the unprecedented fall in prices of farm products, it becomes evident that the farmer has reached the crisis and must be able to put his hay, grain live stock, fruits, and vegetables on the market at less cost, if he is to avoid bankruptcy.

"The Interstate Commerce Commission can properly reduce rates, if such a reduction will mean an increased volume of traffic and the consequent increases in the net revenues of the carrier. Testimony is abundant to show that the farmer simply refuses to send his goods to market at the present level of freight rates. Attention is called to the average prices received on the farm in April, 1920, and April, 1921, as shown by the department of labor. Potatoes dropped from $2.96 per bushel to 79c; hogs from approximately $14 per cwt. to $9; beef cattle from $9 to $6 per cwt.; sheep from $11 to $5 per cwt.; wheat from $2.34 to $1.34 per bushel; oats from 91c to 39c per bushel; wool from 51c to 9c per pound; beans from $4.41 to $3.89 per bushel. Potatoes, sheep, corn, oats, wool, and beans are all selling today at prices less than the 1916 level.

"According to the Department of Labor Statistics, farm prices are 25 per cent above pre-war (1913) and all commodities are 62 per cent above, while reports to the Interstate Commerce Commission show that railroad revenues per net ton mile are 66 per cent over 1913.

County Farm Bureaus Save You Money

A report by the States Relations Service of the Department of Agriculture, summarizing the work of the county agents in 1920, shows that during the year the county farm bureaus and the county agents helped to organize 1,988 co-operative associations. These co-operative associations did a business totaling $39,562,964, resulting in a saving to the farmers of $2,899,764. The total business done by all co-operative associations co-operating with the Farm Bureau and the county agent amounted to $375,714,660, and resulted in a saving to the farmers of $21,152,773. This item alone resulted in a saving of $31.33 to each member of the county farm bureaus.

An effort was made to have a tariff on hides and vegetable oils included in the emergency tariff law. The farm bureau is preparing to make requests for duties on these products in the permanent tariff bill.

The Tincher Bill on control of speculative grain trading is still in the Senate Agricultural Committee.

Ayrshire Meeting at Middlesex Meadows

The annual meeting of the Ayrshire Cattle Breeders' Association of New England was held at A. Henry Higginson's farm, Middlesex Meadows, Massachusetts, May 18. A large number were in attendance and a very enthusiastic meeting was held.

Robert L. Knight, Rhode Island, and Charles W. Wilson, Vermont, were elected directors for three years W. Grant Fancher, Massachusetts, was elected secretary-treasurer for one year.

J. G. Watson, secretary of the Ayrshire Breeders' Association of America, gave a very interesting address on the progress and prices of the Ayrshire cow both in Scotland and here and of the census he is now compiling of the New England Ayrshires. Professor J. M. Fuller of the New Hampshire State College gave a very pleasing talk on the breeding of the Ayrshire at the College, beginning in a small way without a large expenditure of money and of the wonderful records made today.

Massachusetts. W. GRANT FANCHER.

Iowa Dairy Calf Club Exhibit

The first boys' and girls' dairy heifer club exhibit held in Iowa will be at the 1921 State Fair. A premium list of $600 is offered, the Iowa State Fair, the Iowa State Dairy Association, and the state associations of Guernsey, Holstein, and Jersey breeders co-operating.

Classes are provided for heifer calves under one year, heifer calves one year and under two, and champion heifers. Only those calves will be eligible to compete for this premium list which are enrolled in one of the pure-bred dairy calf clubs in Iowa. The members of these calf clubs will make the trip to the Iowa Fair and be regularly enrolled in the State Fair Club Camp.

". . . places far apart are brought together, to the present convenience and advantage of the Public and to the certain destruction, in time, of a host of petty jealousies, blindnesses and prejudices, by which the Public alone have always been the sufferers."
From Charles Dickens' Preface to Pickwick Papers.

The Advance of Understanding

Even romance of sixty brief years ago could not imagine the great advance heralded by the passing of the stage coach. The railway and telegraph were coming into their own; but the telephone had not been so much as dreamed about.

Yet the wise men of that day saw the imperative need. They saw the value of every step which brought people into closer communication with each other. They knew this to be the one way to increase understanding; and to eliminate the "host of petty jealousies, blindnesses and prejudices, by which the Public alone have always been the sufferers."

Then came the telephone. And with its coming time and distance are swept away and a hundred million people are made neighbors.

Places far apart are brought together by 34,000,000 conversations a day over the Bell System.

Western Canada Offers Health and Wealth

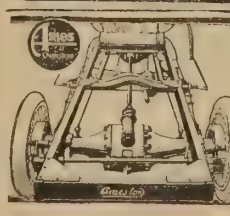
and has brought contentment and happiness to thousands of home seekers and their families who have settled on her FREE homesteads or bought land at attractive prices. They have established their own homes and secured prosperity and independence.

In the great grain-growing sections of the prairie provinces there is still to be had **on easy terms**

Fertile Land at $15 to $30 an Acre

—land similar to that which through many years **has yielded from 20 to 45 bushels of wheat to the acre**—oats, barley and flax also in great abundance, while **raising horses, cattle, sheep and hogs** is equally profitable. Hundreds of farmers in Western Canada have raised crops in a single season worth more than the whole cost of their land. Healthful climate, good neighbors, churches, schools, rural telephone, excellent markets and shipping facilities. The climate and soil offer inducements for almost every branch of agriculture. The advantages for

Dairying, Mixed Farming and Stock Raising



make a tremendous appeal to industrious settlers wishing to improve their circumstances.

Turn Your Old Car Into a Money-Making Motor Truck With an Ameshilt Worm Drive Truck Unit

At from 1-5 to 1-3 the cost of any truck of equal capacity, the Ford, Buick, Dodge, Cadillac, Reo, Oakland, Chalmers or Maxwell, or any other make car with transmission amidship can be made into a Guaranteed Worm Drive 1 1-2 or 2 ton truck with an Ameshilt Worm Drive Truck unit. Not a slow, cumbersome makeshift, but a complete motor truck assembly Save the engine, front axle and side members of your old car--sell the rest. Then bolt on the Ameshilt Truck Unit frame and you have a sturdy, dependable, money-making truck. Worm drive, as used in all best motor trucks. Bears the famous "Ames of Owensboro" absolute guarantee. Saves money and makes money for you. Write for literature and prices.

THE F. A. AMES CO., Incorporated 651 Main Street, Owensboro, Ky.

Makes More High Grade Hay

WHETHER you feed or sell it, high grade hay is worth $6.00 to $10.00 more per ton than poor hay, because of the additional nutrition it contains. You can get high grade of hay and this extra profit at no extra expense—no additional time or labor required—just use the Dain System of Air-curing hay and the JOHN DEERE DAIN SYSTEM RAKE—(The Rake with the Inclined Frame.)

With this rake you can follow the mower closely, rake while leaves are still active and place the hay on clean stubble in loose, fluffy windrows through which the air circulates readily—the bulk of the leaves inside, stems outside. The hay is not sun-scorched, but is air-cured—the ideal way—"Nature's Way" of curing hay.

The Dain System Rake does this most successfully because it is the rake with the inclined frame—capacity is greatest where volume of hay handled is largest.

Unusually big range of tooth adjustment to suit varying field conditions; curved teeth properly speeded to pick up all the hay gently but positively — no threshing of leaves.

In case of rain, you can, with this rake, turn the windrows upside down as often as necessary, always keeping the windrows loose.

FREE BOOK—"Better Farm Implements"—114 pages describes the Dain System of air-curing hay. Also illustrates and describes briefly the entire line of John Deere Farm Tools. Write today, address John Deere, Moline, Illinois, and ask for package DS-714.

Association Notes

West Bend, Wisconsin:—The condensery paid 50c per pound for fat during April; the creamery, 40c; and the cheese factory, 45c. Milk retailed for 6c per quart; butter, 40c per pound; cheese, 20c. Barley sold for 75c per bushel; oats, 45c; corn, 56c; bran, $28 per ton; middlings, $28; oil meal, $46; gluten, $39; hominy, $26; Wisconsin Balanced Ration, $42; clover hay, $23; International Special Ration, $40; silage, $7; alfalfa hay, $25.

Monticello, Wisconsin:—Two pure-bred Holstein bulls were bought to replace inferior ones in grade herds. Two more members are testing herds for tuberculosis. During April, market milk testing 4 per cent sold for $2.35 per cwt. Six cents were paid for each point above. The creamery paid from 30c—50c per pound for fat. Milk retailed for 10c per quart.

Lycoming, Pennsylvania:—During May market milk testing 3 per cent sold for $2.30 per cwt. and four cents were paid for each point above. The creamery paid 40c per pound for fat. Milk retailed for 13c per quart and butter for 50c per pound.

West Branch, Pennsylvania:—One member had his herd tuberculin tested. Another sold three unprofitable cows. A concrete watering trough was built on one farm. During April market milk testing 4 per cent sold for $2.30 per cwt. Mixed hay sold for $17 per ton; corn silage, $6; cottonseed meal, $42; linseed meal, $52; wheat bran, $38; corn and cob meal, $21; ground oats, $26; corn stover, 5c per bundle.

Clinton, Pennsylvania:—Several cows were sold as unprofitable. Twenty-two out of 25 members have signed for the accredited tuberculin test. This community is far in the lead in Wayne County due to the good spirit shown by the testing association members. A grade Holstein owned by Bert Kennedy still leads in the production of milk and butterfat. Her record for eight months is 1,116 lbs. milk and 410.7 lbs. butterfat. During April, market milk testing 3 per cent sold for $2.10 per cwt. The creamery paid 44c per pound for butterfat. Butter retailed for 47c per pound. Feed cost as follows: hay, $18 to $20 per ton; gluten, $50; bran, $36—$38; cottonseed meal, $47—$50; oil meal, $47; corn meal, $34.

Southern Franklin County, Pennsylvania:—One profitable and one unprofitable cow was sold. Two pure-bred bulls were purchased. Five pure-bred Holstein cows were officially tested for Advanced Registry. Market milk testing 3.5 per cent sold for $2.54 per cwt. and 22c per gallon. The condensery paid 45c per pound for fat and in addition 50 cents per 100 lbs. milk. The creamery paid 45c per pound for fat and the cheese factory, 42c. Milk retailed for 10c per quart; butter, 35c per pound, and cheese, 30c. Bran cost $40 per ton; oats, $42; corn and cob meal, $20; cottonseed meal, $45; linseed oil meal, $45; hay, $15; stover, $6; silage, $6.

McCracken County, Kentucky:—One unprofitable cow was sold. A pure-bred Jersey bull replaced a scrub bull. A pure-bred Jersey bull calf was placed with one dairyman who had been breeding to the "handiest" bull. Market milk testing 3.8 per cent sold for $2.73 per cwt. The creamery paid 30c per pound for fat. Milk retailed for 15c per quart and butter for 40c per pound. Bran sold for $1.10—$1.25 per cwt.; mixed feed, $1.40—$1.50; crushed corn, $25 per ton; cottonseed meal, $25.

Vermilion, Ohio:—The farmers received $3.25 per cwt. for 3.5 per cent milk and $2.00 a hundred for surplus milk. Oats sold for 45c per bushel; corn, $1.00 per cwt.; cottonseed meal, $40 per ton; oil meal, $49; bran, $30.

Grand Isle Co., Vermont:—Ray Allen has learned after eight months of testing that his cows will qualify for the Advanced Registry so has entered three to start. Other members are considering official work in the near future. Frank Knight's fourteen grade Holsteins averaged 38.8 lbs. butterfat and 1,065 lbs. of milk. Hay is $20 per ton, silage $8 per ton and grain mixtures from $35 to $56 per ton. The highest prices are for the ready-mixed rations.

Cabot, Vermont:—Five hundred cows in twenty-six herds are tested regularly. Fourteen cows reacted to the tuberculin test and 9 unprofitable cows were sold. Twenty-two members are mixing their grain at home, the majority buying their feed from the co-operative exchanges in Washington and Caledonia Counties. The grain rations cost from $42 to $54.20 per ton. The mixture used most is 200 lbs. bran, 300 lbs. cottonseed meal, 300 lbs. corn meal, 200 lbs. ground oats, 100 lbs. oil meal, and 100 lbs. wheat middlings. Hay is worth from $13 to $20 per ton and silage $6 to $8 per ton.

Elkhorn-East Troy, Wisconsin:—Ten cows sold as unprofitable and twelve cows sold as reactors to tuberculosis. The average returns for one dollar expended for feed were $1.40 and the average feed cost of one pound of butterfat was 37c and of 100 lbs. milk, $1.44. We expect these figures to change considerably as the cows are being turned to pasture. During April, market milk testing 3.5 per cent sold for $2.35 per cwt. The condensery paid 53c per pound for fat. Butter retailed for 38c per pound and

cheese for 28c. Bran sold for $24 per ton; middlings, $24; oil meal, $34; brewers grains, $32; ground oats, $26; silage, $6; mixed hay, $22.

Empire-Osceola, Wisconsin:—During the past month five cows have been sold for beef and two have been sold for dairy purposes. Most of the cattle are out on pasture and there is plenty of hay and silage left to be fed when the pastures get dry. The condensery paid 50c per pound for fat during April, and the cheese factory, 48c. Alfalfa cost $16 per ton; silage, $8; clover hay, $16; bran, $29; oil meal, $45; cottonseed meal, $45; oats, $26; barley, $28; corn, $30.

Fairfax, No. 2, Virginia:—Market milk testing 3.5 per cent sold for $3.70 to $4.20 per cwt. during April. Silage sold for $10 per ton; alfalfa hay, $30; mixed hay, $20; cottonseed meal, $42; beet pulp, $45; bran, $37; corn meal, $36.

Snohomish Valley, Washington:—Twenty-five unprofitable cows have been disposed of for beef purposes. The fat average for our herds increased from 28 lbs. in December to 40 lbs. in May. Market milk testing 3.2 per cent sold for $2.50 per cwt. The creamery paid 28c per pound for fat. Milk retailed for 10c per quart and butter for 30c per pound. Feed prices: Ground barley, $44; ground corn, $44; soy bean meal $55; ground oats, $45; shorts, $35.

A Year's Report

The completed records of the Southern Blair Cow Testing Association for the year ending April 30th, 1921, compare very favorably with those of the year ending the same date 1920. The herd producing the highest amount of milk per cow in 1920 was owned by H. B. Replogle, while in 1921 it was owned by W. M. Howett. Mr. Howett can claim considerable credit because his herd average increased from 6,989 pounds per cow in 1920 to 10,130 pounds per cow in 1921. He accomplished this unusual increase with practically the same cows.

The average production for the last year in the 19 herds summarized was 7,324 pounds of milk and 288 pounds of butterfat per cow. Cost figures, including grain, roughage, pasture, labor, hauling of milk, interest, depreciation and general expense, plus 10% for managerial ability, show that the 1,544,000 pounds of milk produced, cost on an average $3.89 per 100 and per pound of butterfat 79 cents. At this rate it cost 8.4c per quart.

The highest production in butterfat per herd was that of Thurman Hileman. The cow having the highest butterfat production, 511.3 pounds, is owned by C. E. Little.

A year ago the association records showed the cost of milk to be $3.37 per 100, or 7.2c per quart.

It will be interesting to the average reader to note that in order to produce 100 pounds of milk the average cow ate about the following ration: Silage, 70.5 lbs.; hay, 16.01 lbs.; stover, 25.16 lbs.; grain, 27.82 lbs. In addition to this the labor required per 100 pounds of milk, 3.3 man hours and .9 horse hours.

The summary given for 46 associations completing work during 1920, gave as the average production for 19,680 cows, 6,141 pounds milk and 248.4 pounds butterfat.

Palatable Corn Stover

While the silo is the best place to store corn, yet there is the occasional farm where it seems impractical to have a silo. Corn stover is not a palatable feed and various methods have been suggested to make it more desirable in feeding dairy cows. The following suggestions come from one of our New York readers who states that this plan was adopted on his farm and found very satisfactory last year:

"The corn stover was stored on the third floor of the barn. The stalks were fed through the feed cutter and allowed to accumulate on the floor below. A little salt was sprinkled at intervals over the cut mass, but a great amount of salt was not used. After lying for a time, the piles warmed up enough to make the cut stover soft. It was then fed to the cows and they ate it readily."

Alta Crest—A New England Farm Rejuvenated

(Continued from page 848)

Barrylyndon, senior and grand champion at the 1920 National.

Fourteen months ago Alta Crest took on a new function and became an importing as well as a breeding institution. William Hunter, formerly a member of the Canadian firm from which Mr. Sagendorph purchased his first Ayrshires, becomes a partner in Alta Crest. The effort of the firm is now directed toward maintaining the breeding ideals of the past and conducting an importing business of equal standard. The fifty-four head brought over last year included animals which won championships at many 1920 shows. Morton Main's Lord Barrylyndon, National grand champion, was one of the fifty-four.

For week ending May 20:

Number of animals registered: bulls, 286; cows, 856; total, 1,142. Number of transfers recorded: bulls, 235; cows, 626; total, 861.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

Fifty-third Meeting of Jersey Cattle Club

JUNE first, for the fifty-third time, the American Jersey Cattle Club met in annual session in New York City. A very fair year's progress was reported, considering agricultural conditions, especially those in the South where the Jersey has her stronghold. Although registrations and transfers during the past twelve months failed to equal the record of a twenty-five per cent increase over the previous year, as reported at the fifty-second annual meeting, Register of Merit testing registered a goodly gain. Club statistics indicate a substantial improvement during the past ninety days, a fact from which the members drew much encouragement.

A pleasant incident of the meeting was the presence of a number of the oldest Jersey breeders in the country. Among them were Mr. E. L. Howe of New Jersey, the only surviving charter member of the club. J. S. Hosford of New York, a breeder for thirty-five years but only recently a member, was present, as was Geo. Blanchard of Maine, a member since 1882, two years after the club was chartered, and a breeder of Jerseys since 1874.

A conspicuous feature of the annual Jersey gathering was the small number of club members in attendance, only 58 of the 927 being present. Two hundred fifty-three proxies were accepted but no occasion arose for their use. Much of the discussion of the day concerned various means for developing a greater interest in the club among Jersey breeders. President M. D. Munn gave expression to a general sentiment when he said: "If the breed is to expand and fulfill its function it must do it on the every day dairy farm"—an institution almost without direct representation in the meeting.

A resolution was passed which permits the nomination of candidates for the board of directors by mail as well as from the floor of the annual meeting. It was offered in the belief that it will give those members who do not attend annual meetings a larger voice in determining who shall represent them on the board.

A recommendation was passed asking the directors to consider the advisability of holding annual meetings of the club outside of New York State, that being made possible for such an organization by a new law passed by the New York legislature.

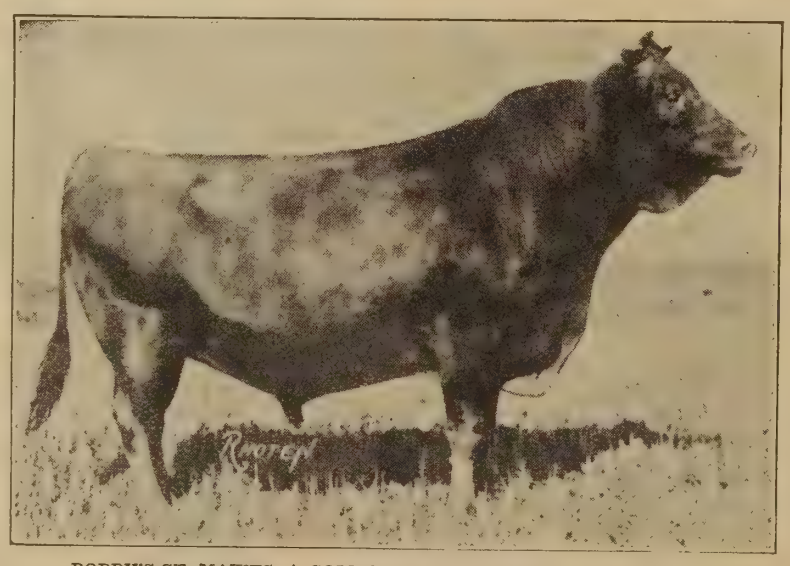
Although there has been a considerably increased agitation for a reduction in the club's $100 membership fee and one member was present with thirty proxies for a reduction, it was voted to be the sense of the meeting that the fee should not be changed.

A storm of protest, led by J. E. Dodge of Massachusetts, arose when it became known that the board of directors had on the previous day approved a plan for substituting a 305-day Register of Merit test for the present 365-day record period. As finally modified after a lively discussion the resolution of the directors simply gives the shorter test official approval with that for a full year.

Secretary Gow's Report

Secretary R. M. Gow's report shows registrations to be only 191 fewer than for the preceding year when the total was 43,119. The number of cows recorded was 31,455 and of bulls, 11,473, the number of imported animals being 374. In the past year 45,228 animals were transferred, a decrease of about 1000 below the number reported in 1920.

In the past year the number of cows on test was increased eight per cent and the number of herds, six per cent. The number of cows entering the Register of Merit in the year ending May 1, 1921, was 2,672 making the total number of cows in the Register, 13,427.



Forty-seven per cent of the club's receipts, according to Mr. Gow, go to breed promotion. "This work," he says, "has been carried on during the year with greater vigor and a better organization than ever before."

A new form of extension activity is what are termed regional field units. Groups of states organize into regional units for co-operative breed promotion work. The American Jersey Cattle Club engages to pay one-third of the expense of such units, up to $2,500. Two such units, the Southwest covering Missouri, Kansas, Nebraska, and Arkansas, and the Tri-State, covering Illinois, Indiana, and Ohio, are now in operation.

The Club's bank balance is reduced $10,871.60 from that of a year ago. The gross receipts for the twelve months totalled $209,874.44 and the expenditures, $220,746.04.

Election of Offices

For the sixth time, M. D. Munn was re-elected president of the Club, his service being continuous since 1915. Following a eulogy by Geo. W. Sisson of New York, Mr. Munn was given an ovation by the members. Geo. T. Chaffee was re-elected treasurer. The new directors elected were: P. H. Frelinghuysen, New Jersey; Hugh Bonnell, Ohio; Guy S. Miller, California; David Moulton, Maine; to replace the retiring members, Geo. W. Sisson, New York; P. B. Weissinger, Kentucky; Meldrum Gray, New Mexico; I. R. Blackburn, Ohio.

POPPY'S ST. MAWES, A GOLD MEDAL JERSEY BULL OWNED BY GEO. BIERSDORF OF OREGON

There are fourteen gold medal sires in the breed and of these seven are from Oregon, five qualifying within the past year. Three of these bulls were bred by Ed. Cary, the breeder of Poppy's St. Mawes.

To qualify for the gold medal class, a bull must have at least three daughters, from different dams, which have records of 700 lbs. or more of fat in a year and carried a living calf at least 155 days of the test. Poppy's St. Mawes' daughters are: Poppy's Olga, 794.26 lbs.; Poppy's Koffee Rosaire, 731 lbs.; and Poppy's St. Mawes Rose, 711.99 lbs.

Cooper's Average $857

84 Linden Grove Jerseys Sell for $72,025 in Decoration Day Auction

At the twenty-first consecutive Decoration Day sale of Linden Grove Jerseys, 84 head brought an average of $857. These represented four importations and included animals bred in America. The auction was one of the best ever held by T. S. Cooper and Sons.

The top price of the day was made by the home bred bull calf, Simone's You'll Do's Fontaine by a son of Imp. Oxford You'll Do and out of a daughter of the Plymouth Lad. R. J. Fleming, Canada, was the buyer at $3,500.

S. A. Guy, Louisiana, was the heaviest buyer, taking ten head for $13,350 including three at $2,500 or more. The Cid's Model headed the list at $2,625, the blood of The Cid being the feature of this year's auction. Another daughter, The Cid's Handsome Stella, went to Mr. Guy at $2,600.

R. C. Tway of Kentucky took six head for $7,525, his top being a yearling grandson of Imp. Oxford You'll Do at $1,750. The cow, Sea Lad's Milk Maid, a granddaughter of The Plymouth Lad, went to B. H. Bull & Son of Canada for $1,925.

From South Carolina

HOARD'S DAIRYMAN:—In your editorial column you ask "What would the dairy farmers think if they were advised to use cottonseed meal as a fertilizer as recommended by the 'Progressive Farmer' "?

I assure you our farmers will soon be using the seed for fertilizer if there does not soon develop a market. Why cannot Wisconsin farmers experiment as North Carolina farmers are doing and use the whole seed, oil and all, chopped up with corn nubbins and cobs for winter feed? This mixture when seasoned with a little meal is the favorite concentrate here. During the summer our little Jerseys thrive on crab grass and underbrush found along the terraces. We have as yet been unable to make good pasture and there is but one silo in the county.

At the last meeting of our co-operative gin the secretary was authorized to sell 50 tons of cottonseed to the highest bidder among the South Carolina cotton oil mills. I doubt that he will be able to get $17.50 per ton, the price of 1,000 lbs. of cottonseed meal on our local market.

North Carolina. A. F. CORBIN.

The Filled Milk Fight

The bill prohibiting the manufacture and sale of filled milk in Wisconsin passed the Assembly by an overwhelming majority, and the Senate committee reported it out unanimously for favorable consideration after a strenuous two-day hearing. The filled milk manufacturers have introduced a substitute regulative measure in hope of defeating the original. On June 2nd the Senate referred these measures to the committee of the whole for a rehearing, which took place on June 7th. It is expected that the original bill will pass and receive the approval of the Governor, thus outlawing the imitation milk from Wisconsin.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, JUNE 1—Secretary of the Treasury Mellon, prior to the confirmation of the appointment of D. H. Blair of North Carolina as Commissioner of Internal Revenue, issued a Treasury Order again postponing the date of taking effect of the neutralized butter ruling until July 1. This is the third postponement while awaiting the appointment of a Revenue Commissioner under the new administration.

Commissioner Blair comes into the office after a hard fight in the Senate over his confirmation. He is a North Carolina attorney and representative of cotton manufacturing and tobacco interests, a life long Republican, and a sound, successful, and experienced business attorney. It was too much for the butter interests who have but little contact with the Revenue Commissioner to expect a man in this place who had special knowledge of the butter controversy, and as this could not be expected this new commissioner is as satisfactory as could be had. He took office June 1.

The contest over the neutralizer ruling has served to crystallize some matters which have been pending for several years, and perhaps will lead to legislation at this session of Congress to settle once for all the controverted questions of butter, ice cream, and perhaps other dairy products standards.

As to the neutralizer ruling itself, the question of whether butter made by the neutralizer process is "adulterated" within the meaning of the butter law, and the definitions of adulteration, which have come to be legally known as the result of the operation of the pure food law is now pretty sure to have another analysis and a new statement of the law from the new attorney general. The postponement order issued May 27, had received the approval of the secretary of the treasury in person on May 20, and this means that Secretary Mellon had found time to himself look up the situation. His action in postponing the ruling can only mean that he is not satisfied with the decision of the previous revenue commissioner and will seek a review. Secretary of Agriculture Wallace has already indicated that he will urge a re-submission of the facts to the attorney general and Attorney General Daugherty who has already had the matter called informally to his attention has stated that it was one of several matters "left on his doorstep" by the preceding administration. The indications are that by July 1 either the ruling will have been reaffirmed or reversed. During the same interval, and dependent somewhat upon what happens in this matter, a decision will have been reached as to the probabilities of getting legislation on this and other dairy matters.

There is again a rumor of an attempt to repeal the ten-cent tax on colored oleomargarine. An eastern senator is said to have determined to again make the effort.

On this subject dairy interests should keep their powder dry. The National Dairy Union has dug up the interesting item that the bulk of oleomargarine demanded by export trade is colored, and the colored oleo made for export escapes all taxation. The fact that foreign consumers, who do not have the information before them as to the vital differences beween butter and oleo, still predicate their demand on resemblance to butter, which shows what will happen here if the bars are let down and this competition permitted.

From behind the closed doors of the Ways and Means Committee some information is beginning to leak out as to tariff schedule as proposed for the general bill, and as to conflicts and contests which are developing between members of the committee. The bill was expected out last week, and the delay caused a lot of questions to be asked, some of them leading to some interesting information.

As was to be expected the vegetable oil schedule is one of the points of conflict. This has been reported by the sub-committee on chemicals, Hon. Nicolas Longworth, chairman, and it is not satisfactory to dairy interests, southern oil producers, or to Chairman Fordney and a number of members of the committee, as nearly as can be learned. Your correspondent has not been able to learn the exact amount of the tariff reported, and so can not state on his own knowledge, but apparently reliable statements made in the Washington newspapers say that two cents a pound is all the tariff that has been reported.

The other members of this subcommittee are Representative Copeley of one of the biggest milk producing districts in Illinois, and the other, Congressman Hadley of the great dairy state of Washington.

On the full committee there are Representatives Hawley of Oregon, Young of North Dakota, Green of Iowa, fully committed to fair protection for agricultural interests, and Chairman Fordney of Michigan who is considered friendly at all times. A big part of the work on this vegetable oil case has thus far been carried by the southern tariff congress, and it is now time that the dairy interests were in action on this matter. Conversation with many members of Congress indicates that the trouble is not antagonism, but inertia and lack of information. The vegetable import oil business is a matter of comparatively recent development, as tariff matters go. There was not oil enough brought into the country eight years ago to cause any great stir over this tariff; now it is coming in by millions of pounds, in a business developed as a war time measure—a food administration measure—which like a lot of other war and food administration measures has its aftermath.

Not only will the members of the Ways and Means Committee welcome information on this subject, but there is not a member of the House but will welcome fair expressions of opinion and statements of fact on this subject. That is the way their opinion is formed, from the information they get from their constituents, and if the butter and milk men do not tell their congressmen about what vegetable oils are doing to them, who will tell them?

With a very few exceptions, it can be said that there is hardly a member of the House who is antagonistic to fair tariff protection to every agricultural interest. That agriculture must be prosperous if the rest of the country is prosperous, is now understood as never before in Washington. President Harding, in his recent conferences with great financial interests relative to foreign trade and foreign financing, has made it plain that his first thought is for a market for farm products. This outlet for the farmers' crops is in every one's mind. But while the leaders have this friendly feeling and general interest, it must not be understood that they will take the laboring oar to get either foreign outlet for farm crops or tariff protection for the American agricultural products threatened with certain cheap tropical products or the products of cheap coolie or peasant labor. If the cottonseed oil industry, the butter industry, the swine growers, the wool growers, or the corn growers, are in danger from this source, they must take up their own fight and must let every member of Congress know the facts.

The Undernourishment of Children

S. R. WINTERS, WASHINGTON, D. C.

MILK is a foe to undernourishment, a statement vividly subscribed to by the contrasting study offered in the accompanying illustration. The absence of this vital fluid in the diet of babies and growing children is an ally, negatively expressed, to inadequate nourishment. Surveys in rural districts and cities alike support these claims.

Recently Miss Jessie Hoover, milk specialist of the Dairy Division, United States Department of Agriculture supervised a milk campaign in Winston—Salem, North Carolina, where it was determined that of 5,647 school children, 2,123 drank no milk. Health authorities weighed and measured 1,866 white children and found 16 per cent underweight, attributable to insufficient nourishment. Similar observations as to 1,806 colored school children revealed a condition of 15 per cent lacking in weight conducive to bodily comfort and stamina. The per capita consumption of milk in this world-renowned tobacco and industrial city was determined by a survey, indicating that each person drank less than one-half cup of milk a day.

Undernourishment also intrenches itself in rural areas. One of the wealthy sections in a county of Kansas is a notable illustration. Of 639 children in 30 school districts, 140 were at least 10 per cent underweight, and only 42 per cent of them included milk in their daily diet. In three townships in Iowa 51 per cent of the children were sparingly developed in flesh and weight. A survey in New York, embracing a period of three years, shows that the percentage of undernourishment had increased from 5 to 21 per cent, the accompaniment of a curtailment of milk consumption by 25 per cent. An examination of 10,000 school children in Chicago revealed the fact that 40 per cent were underweight, and to the surprise of the government investigators, 57 per cent were children surrounded by pleasing environments of comfortable homes in a residential section of the city.

Forty campaigns in cities and rural sections throughout the United States, covering a period of two years, have been directed by the Dairy Division in an effort to stimulate an increased milk consumption. Beginning in Connecticut in 1918, where six cities endorsed the movement, the idea spread until the following cities have sponsored milk campaigns: Detroit, Pittsburgh, Kansas City, Topeka, Davenport, Iowa City, Akron, Spokane, Seattle, and Madison. Iowa and Kansas enlisted for state-wide action for two years. Miss Hoover, milk specialist of the Dairy Division, in suggesting objects of a milk campaign, says: "Two important reasons for undernourishment in children are poverty and lack of understanding of the nourishing properties of certain foods. What milk campaigns do to teach the value of milk for the growing child is that much added to the general progress of child welfare."

A milk-feeding demonstration conducted in the schools of Kansas City strikingly reveals the value of milk in the diet. Thirty-seven per cent of the children were undernourished at the outset of the demonstration. A school lunch composed of milk and graham crackers, supplied continuously for four months, reduced the percentage of undernutrition from 37 to 25 per cent. Five months later, favored by the diet of milk and crackers, only 3.7 per cent of these children were underweight. A testimonial from the president of a women's college in the South is a liberal endorsement of the efficacy of the vital fluid: "For 67 years we have never had a death of a boarding house student. We have our own herd of dairy cows. What milk we can not use we sell. We went through the influenza epidemic safely by keeping the dormitories heated evenly, and then feeding milk."

A LESSON IN BEFORE AND AFTER TAKING

At the left is the photograph of an undernourished child taken before receiving the attention of a doctor and a visiting nurse. At the right is the photograph of the same child, now well nourished, after receiving properly prepared, clean milk at regular hours. This photograph was secured through the U. S. Dairy Division.

A study of one of the best agricultural counties in New York State shows that 71 per cent of the farm houses have not been painted in the past five years.

EDITORIAL COMMENT

"INDIVIDUALITY brought the money and records and even breeding played second fiddle." This statement was made by Editor Price of the Holstein-Friesian World concerning the Brentwood Holstein Sale. Individuality of an animal is important, and it would be fatal for any breeder to ignore it, but to place it ahead of both records and breeding is a signal of danger. Why do we breed pure-bred cattle?

J. M. HACKNEY, vice-president of the Holstein-Friesian Association, in the Holstein-Friesian World has said: "Fairly well bred pure-bred animals will continue to be worth from $250 up in accordance with the record back of them for it is the records that make them worth the money. In other words, it is the proof of their value. There are a lot of us who believe in the show animals, and we want the right type, but there would not be any of us engaged in the business, if they did not produce milk."

Mr. Hackney states clearly why we breed pure-bred cattle.

THE dairy farmers have found that it requires eternal vigilance to prevent so-called dairy substitutes from claiming their markets. Isn't it strange that the greatest benefactor of the human race, the cow, should be kept constantly on the warpath to protect her products from fraud and deception? Perhaps we should complacently accept this condition for, in the make-up of the world, struggle holds a prominent part on the stage.

Dr. Hart has said: "Milk is our only protective food." That is, when milk forms a portion of our diet we are pretty sure of being properly nourished. In view of this, both the consumer and the dairy farmers must be alert to the danger of so-called dairy substitutes.

NATIONAL DAIRY SHOW

The committee of one hundred, made up of men engaged in various branches of industry in the Twin Cities, and appointed to assist in making the National Dairy Show of the largest value to the Northwest, has begun its active work. It has brought the various business interests in contact with Mr. W. E. Skinner, manager of the National Dairy Show, for the purpose of laying plans for this year's dairy exposition which will be held at the Minnesota Fair Grounds, October 8th to 15th. Mr. J. M. Hackney of St. Paul is chairman of the committee.

ENSILING CLOVER AND ALFALFA

Those who have not an adequate supply of silage for the short grass period, which invariably comes in the later part of July and August, will find it advantageous to ensile some of the alfalfa or clover crop. This would provide silage for a period when it is needed as much as, if not more than, during the winter. Hot weather, flies, and dry pastures are no conducive to large flows of milk. If the dairy farmer is not alert to the requirements of his cows the flow of milk decreases abnormally fast. Silage and a little meal should be fed during the drouth seasons. They will not only help to sustain the flow of milk, but will put the herd in better condition for next winter's work.

Further, the first crops of clover and alfalfa come at a time when it is difficult to make good hay and on account of rain extra labor is required in curing and storing the hay. Some have come to the conclusion that the simplest and cheapest way of curing the first crops of clover and alfalfa is to ensile them. Under certain conditions this would be the best way, no doubt, but under average conditions, especially where corn is grown, the acreage of legumes is limited. Just enough clover or alfalfa hay is raised to supplement the silage during the regular feeding season. In the building of winter rations it is important that an adequate supply of alfalfa or clover hay be provided.

Notwithstanding this there are many instances where a part of the first crops of clover and alfalfa can be ensiled with profit. Succulent feed in July and August is fully as essential as during the winter.

PAYING FOR CHEESE

The Wisconsin Cheese Producers' Federation until the present time borrowed money in order to pay their patrons upon the same basis as private corporations. Last year during the flush of season, this organization borrowed more than $250,000 and the total interest charged for the year amounted to $10,000. This interest money came out of the pockets of the patrons of this co-operative enterprise and shows what it cost to pay for the cheese promptly.

Through the recommendations of the Wisconsin College of Agriculture and the State Division of Markets, the Federation has adopted a new plan for paying for cheese. Cheese manufactured in June will be paid for on July 20; this plan will be carried out the same for all months. It means the Federation will have opportunity to market June cheese and receive a large portion, if not all, of the money by July 20. It would seem that the patrons of co-operative organizations would understand that when they have no operating capital this plan is essential and that when co-operating upon this basis the producer receives a larger return for his product.

If the patron understood why it was necessary for a co-operative organization to defer payments, those who are working against this form of organization could not use the argument effectively that a particular co-operative company was about to fail. There is no such thing as failure in a co-operative enterprise if the members will sell their products to it and wait until the money is returned for their products before they require payment.

BANKER AND FARMER

George A. Fox, Director of Finance of the Illinois Agricultural Association, is attempting to bring about a closer relationship between the banker and the farmer. In a series of meetings held in Illinois, he pointed out the relationship of agriculture to the various other industries of the country. He showed the bankers that 50% of the country's purchasing power is on the farm and what it means to have a system of agriculture that is permanent and efficient; and in order that the farmer may be properly served the banker must extend to him a different credit than is given to the manufacturer and other business men.

Mr. Fox stated that in the past agricultural colleges and other agencies urged the farmer to increase his production, but he showed that the farmers do not make the most money in the years of greatest production. He said: "The farmer has come to realize that he must not only produce well but he must market well. He has done bankers and manufacturers the honor of adopting some of their business methods. He is learning to market his products as well as to produce them. Production alone can't bring the stability to agriculture that is necessary. Consider that 35 per cent of the capital in business is invested in marketing machinery and it must be seen that the farmer must also develop his marketing machinery. There was never a depression in agriculture but that the rest of the country suffered from the same depression."

It is important that all bankers of the country thoroughly understand that the marketing program of the farmer is not being contemplated to secure monopoly or to injure any other business, but to improve the method of getting his products into the hands of the consumer. It is recognized by leaders in agriculture that the law of supply and demand must regulate the price, but a system of marketing farm products which permits a little surplus to depress the prices of farm products relatively lower than other commodities is not a good thing for the farmer or for the other business interests of the country.

No nation is safe unless it has at all times some surplus food in storage. To accomplish this it is necessary to have a surplus of food for protecting the nation against famine in the lean years that may come, and in order to not have it operate against the prices of farm products a better system of marketing must be brought about.

AN AGRICULTURAL INQUIRY

A resolution providing for a special commission of agricultural inquiry has been favorably reported by the Agricultural Committee of the Senate and approved by the Rules Committee of the House. The purpose of this commission is to investigate agricultural conditions and to determine why farm commodities have been liquidated more than other commodities and why agriculture has not been properly financed.

It is our opinion that creating an agricultural commission of inquiry would be desirable. It would have authority to gather various facts pertaining to the marketing of farm products and other information which would be of value to the farmers of this country. We are firmly of the belief that it is not sufficient to remonstrate against conditions but that we must get exact knowledge in order to locate our trouble and to bring about effective corrective measures. It is easy for anyone to complain, but fault finding has never helped any industry. What we need is more knowledge and fewer opinions. Knowledge clarifies issues, while opinions may befog them.

If this commission is made up of capable and honest men who have a desire to get at the bottom of our economic conditions, it may be able to present a plan which will assist in bringing about a more speedy readjustment, in establishing various agencies for the purpose of serving agriculture, and in overcoming practices which are now disturbing proper relationship.

Senator Lenroot of Wisconsin has said of this resolution: "Nothing like it has ever before been suggested to Congress. The farmers have builded greater than they know. If the spirit of the resolution is faithfully interpreted and intelligently adhered to, we will find out the cause for the ailments which we now know are afflicting the country."

Congressman Cockran of New York has said: "I am in hearty sympathy with the concurrent resolution providing for the appointment of a commission to inquire into the present condition of agriculture and if possible to suggest remedies for the depression under which it is suffering."

Congressman Robinson of Kentucky says: "I am anxious to know the trouble and to remove the causes."

It would be a good thing if every reader of Hoard's Dairyman interested in securing knowledge of our present economic conditions would write his congressman and senators, urging them to support the resolution which has been recommended by the Agricultural Committee of the Senate and approved by the Rules Committee of the House.

Three Men Overcome Moldy Silage

Reports as to moldy silage continue to come to us in apparently increasing number. A year ago, we saved out three such inquiries and in writing these men recently we asked them for their experience during the past season. As these replies cover three different states and all of them report success from the earlier ensiling of their corn, it would seem to indicate that perhaps one of the largest causes for moldy silage is the practice of

ensiling corn when too dry. We give below the letters from these three men and would ask other readers to send in their experiences along this same line:

Mr. Ross Shindeldecker of Michigan writes: "My silage this year was good to the last feed. The corn from which it was made was planted late and was still green when put into the silo. Most of the ears were in the milk and I thought it was too green to make good silage but it was never better and the cattle eat it with relish. Whether I have been filling my silo when the corn was too ripe, I am unable to say but I have decided to try filling again this year when the corn is green."

Mr. J. F. Puterbaugh of Ohio writes: "My ensilage has made a marked improvement over the 1919 product. I believe this improvement is due first to the fact that I used my own cutter this time, while last year I used a neighbor's that had only two knives. The four knives on my cutter seemed to cut the corn better and it apparently packed closer. In the second place, I ensiled the corn when it was considerably greener. The year before, I believe my main difficulty was due to the fact that the corn was too dry to pack well. I had some that spoiled in bunches at the top this year but it was not all the way through the silo as last year."

Mr. R. H. Van Slambrouck of Minnesota writes: "After studying the situation over carefully I came to the conclusion that the trouble might lie in the fact that the cement foundation (it is a stave silo) was built with quite a prominent shoulder sticking out into the silo, and it was my belief that this might hinder the silage from settling properly. This we remedied by slanting boards from the shoulder to the wall of the silo, being very careful to make a nice smooth job of it. We filled one week earlier than usual, the corn was real green, although the ears were beginning to mature, and used no water. We were very careful about tramping, having from two to three men in the silo at filling time. The result was splendid silage, with little or no mold. Just what was the real reason for the better silage, I am not sure, but I am more or less inclined to think that while some of the other things mentioned above might have helped, I have always been more successful with silage when the stalks were yet entirely green, just before the lower leaves begin to dry up. You will recall that in my previous letter I wrote that I had been filling when the lower leaves began to die and the corn quite mature, adding a small amount of water through the blower."

Cistern for Liquid Manure

Please give me information concerning concrete liquid manure pits. We have twenty head of cattle and three horses; all to drain to the one pit. Would like to know size required, etc. I figure on emptying once a year.

Pewaukee, Wis. K. V. T.

I have visited a large number of farms where liquid manure cisterns are used, but I have yet to see a liquid manure pit designed to hold the urine from a herd for the entire season. The average cow will void from twenty to thirty pounds of urine in twenty-four hours. If we suppose that in the course of a year, half, or even a third, of this is dropped in the barn where it can be recovered it would necessitate the construction of a cistern having a capacity of from five to nine hundred cubic feet per head of stock kept on the place. This would be an exceedingly large tank. Even if it were practical to build one this size I can not see any advantage in having storage space large enough to require emptying it only once a year. Even under most favorable conditions there is a constant deterioration of the valuable nitrogen content of the liquid, and the longer it is stored the greater will be this loss. For this reason those who make the best use of the liquid manure remove it from the cistern during nearly every month of the growing season.

Liquid manure gives excellent results when applied to grass land just as early in spring as the ground begins to thaw. Top-dressing of small grains gives big returns. Cultivated crops may be side dressed to advantage. The liquid manure is beneficial when applied up to the very time the ground of meadows and winter grains begin to freeze up in the fall. Hence it is only during the real winter months that it is not possible to apply it.

If there is no place in the field to apply it the liquid may well be pumped back over the solid heap and allowed to again find its way to the cistern.

Concrete construction makes probably the most efficient and durable liquid manure cistern. Such a reservoir should be of a size sufficient to provide about twenty cubic feet of storage space for every head of cattle kept on the farm. It is best when making building plans to provide for any future expansion of the herd. A liquid manure cistern may be built cylindrical or with square sides. If of the former type it should have a diameter of eight feet and a depth of ten feet to take care of the excrement from twenty head of cattle. If of the latter type the dimensions of the pit for about the same capacity should be about five by eight by ten feet deep. A six-inch wall thickness is considered sufficient for liquid pits of this size.

In selecting the site for the manure cistern one should be sure to so place it that the top will be lower than the bottom of the manure pit, so that the drainage from the pit will flow into the cistern as also the liquid from the manure gutters in the barn. The cistern will work most effectively in preventing deterioration of the urine if it is partly or entirely submerged below the surface of the ground. A tight cover should be placed over the cistern having a manhole to permit cleaning it out. A diaphragm pump works well to pump the liquid into the distributing carts.

Wisconsin C. A. LeCLAIR.

Beet Seed in Ration

I have several thousand pounds of sugar beet seed which has tested out 85%. Will you advise if this seed is ground to a meal if it can be fed to dairy cows with some other grains?

Maryland. J. B. W.

So far as I have been able to find there is no American data on the suitability of sugar beet seed for stock feeding. However, I find in Pott's "Handbuch der tierischen Ernahrung und der landwirtschaftliche Futtermittel" Volume II, the statement that sugar beet seed which does not germinate has been used with good success in Europe for feeding fattening cattle and also for horses and swine, when ground and mixed with other concentrates.

According to this authority the composition of beet seed is as follows: Dry matter, 89.5 per cent; crude protein, 14.3 per cent; crude fiber, 28.9 per cent; nitrogen-free extract, 32.2 per cent; ether extract, 8.4 per cent; mineral matter, 5.7 per cent.

It should be noted that the beet seed runs rather high in crude fiber so that we would not expect it to have anywhere near as high a value as farm grains. However, as it undoubtedly has considerable feeding value, it should not be wasted. European authorities estimate that the ground beet seed has two-thirds to three-fourths the feeding value of wheat bran. I would not advise having the beet seed form the only concentrate, but would feed two to three, or possibly four, pounds per head daily in a mixture of other suitable concentrates to dairy cattle.

University of Wisconsin. F. B. MORRISON.

Sweet Clover for Nitrogen

Sweet clover offers the most promising indications that the problem of supplying a cheap source of available nitrogen (nitrate) for farm crops can be solved. Bulletin 233 of the Illinois Agricultural Experiment Station just issued sets forth the merits of sweet clover in its ability to conserve the nitrate of the soil, to add nitrogen to the soil, and, by its rapid decomposition, when plowed under, to produce nitrate in ample amounts and at the proper time for the corn crop.

Results obtained from fields in various sections and of different soil types where sweet clover seeded in wheat has been plowed under in the spring of the second year for corn, are presented showing the influence of this practice on the nitrate content of the soil.

Corn occupied all the plots concerned in the study. The large nitrate requirement of this crop made it desirable to study the effect of the sweet clover treatment in its presence. It was found that the plots on which sweet clover was growing in the spring contained more nitrate than untreated soil or manured soil, and that within three or four weeks after the sweet clover was plowed under the nitrate content of the soil was in most cases doubled and continued to increase in spite of the fact that the corn crop was utilizing considerable nitrate on these plots. The critical period in the growth of corn usually occurs between June 25 and July 15, when the greatest demand for nitrate occurs. It is shown by the study that sweet clover may be relied upon to furnish sufficient nitrate nitrogen for the corn crop, and that it properly meets the critical feeding period above mentioned. The results were as outstanding on gray silt loam as on the brown silt loam.

From the data on the nitrate content of the soil and the nitrogen content of the sweet clover tops, it is clear that a material addition of nitrogen was made to the soil, from the air, through the growing of the clover. The information contained in this bulletin deals directly with a vital factor in crop production and proves the value of green sweet clover as a cheap source of available nitrogen for corn. It emphasizes the importance of this crop in well-planned systems of soil improvement. —A. L. Whiting, Illinois College of Agriculture.

Ensiling Corn Stover in Spring

HOARD'S DAIRYMAN:—In regard to ensiling corn fodder will state that I have been doing this for the past three years with very good success. I have two silos 12x34 feet each and the past three years have not had enough silo room, so I would fill one silo with the dry stalks as soon as it was fed empty or some time in February or March.

I always stack my stalks next to the silo when dry enough to stack. The corn was ensiled with an ordinary silo filler. I used two three-quarter inch hose, ran same into blower and fed machine rather slowly, barely lapping bundles. This grade of silage kept very well; in fact, there were no moldy spots as is sometimes the case when fall filling with dead ripe corn. This silage was not fed for four months after being ensiled as I always fed the other silo of fall ensiled corn first and used this spring cut silage for summer feeding.

There seemed to be no difference as far as palatability is concerned. My cows ate that silage just as well as fall silage. In fact, fall cut silage made from immature corn is rather sour whereas if it is ensiled in spring or winter it will not be sour. I noticed very little, if any, difference in amount fed and results. Some of my neighbors that saw this silage could hardly believe it to be spring silage. They said they never saw or smelled better silage. I do think that a little more of spring cut silage spoils on top when not opened for four months as it is not quite as heavy and for that reason does not pack so well.

Wisconsin. WM. H. TAMM.

HOARD'S DAIRYMAN:—I have tried ensiling corn stover in the spring twice and in both cases found it practically worthless. In both cases, I ran a three-quarter inch stream in the blower while filling and then let it run for two nights and a day after filling, but even with this amount of water it did not moisten the corn thoroughly and it was left so dry that it did not pack well and so molded very badly.

The first time I filled during the Christmas holidays. The fodder had been outside and had a great deal of ice and snow on it. When I started to feed, this silage was as dry as shredded fodder but it had molded. The last time I tried this method, I filled in the fall right after seeding, husking out the good corn. About half of this ensilage could be fed but the cattle did not care for it and did not do well on it.

I recommend that farmers fill the silo when the corn is at the proper stage or else feed it as corn fodder or corn stover.

Virginia. D. RAY WHITESEL.

Ration for Cows on Pasture

From the following feeds please balance me a ration to feed Holstein cows running on grass: corn, 60c per bu.; oats, 40c; cottonseed, $40 per ton; bran, $1.10 per cwt.

Clarkesburg, Ill. C. W. S.

A very good mixture of grain for cows on grass is 300 lbs. ground corn and 100 lbs. ground oats or bran. Grass provides all the protein required for producing good flows of milk. This is especially true when the grass is good and before the dry season begins. The amount fed at this time will have to be determined by the milk flow of the cows and the condition of the pastures. Since grass provides an adequate supply of protein, we suggest a mixture of meal rich in carbohydrates. Then, too, it has been found that corn alone is a good supplement to pasture. There are some properties in corn that make it one of the best feeds when cows are grazing.

If desired, a mixture of 500 lbs. ground corn, 100 lbs. ground oats, 200 lbs. bran, and 100 lbs. cottonseed meal could be made for supplementing the pasture.

DAIRY MARKET NEWS

May Milk Prices

(From Report by U. S. Bureau of Markets)

Table I represents a comparison of the net prices received during May by producers in 3,102 local markets for fluid milk (test 3.5%) f. o. b. local shipping point or distrbutor's plant.

Table I—May Producers' Prices by Geographic Sections

Sections	Range of prices per cwt.	Comparison of average prices 1921 May	1921 April	1920 May

The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price paid the producer at his railway station. In certain cities the prices given apply only to that portion which is considered as the producer's average production, the surplus being handled either by the producers' association or the dealers at somewhat lower prices. Detailed information as to the selling arrangements between producers and dealers in various markets may be secured by writing Division of Dairy Products, Bureau of Markets, Washington, D. C.

The prices given in Table II have been compiled on the comparative basis of milk testing 3.5% fat, different cities varying from 3% to 4% as the basic fat requirement on which prices are fixed. Certain markets pay on a straight price per pound fat, but most of them set a price per hundred pounds milk of a certain test and then add to or deduct from this price a certain number of cents for each one-tenth per cent in test above or below the basic test. The most usual allowance is from 3 to 5 cents for each one-tenth per cent, or "point" as usually called.

The prices paid by consumers given in Table II are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in nearly all cases is for pasteurized milk.

To reduce the prices per hundredweight, given in these tables, to either a gallon or a quart basis divide by 11.63 or 46.33 respectively.

Prices at Country Shipping Stations

Prices paid during May per hundred pounds for standard grade milk (Grade B, 3.5%) at the dealers' country receiving stations or at producers' railway shipping points, as also prices f. o. b. city, are given in Table III.

Table III—May Producers' Prices Per Cwt. F. O. B. City and at Country Stations

Cheese Trading Light

(Report by U. S. Bureau of Markets)

Cheese markets during the week ending May 28 failed to take on the activity which dealers have been expecting, but on the whole the amount of cheese which is moving into trade channels has increased materially over what it was a month ago. Within another few weeks conditions are expected to show considerable change.

Another factor which seemed to have been in part responsible for lighter trading during the week than had been anticipated was the difference in prices on the two cheese boards in Wisconsin. The new Farmers' Call Board held its first meeting May 23, and on most styles prices were higher than those which resulted from selling on the Wisconsin Cheese Exchange. The result was that when dealers tried to base their selling prices on the quotations of the former, there was some confusion, and a little readjustment had to be made. In this connection it might be mentioned that the prices reported daily by the U. S. Bureau of Markets represent actual selling prices as they may be influenced by either or both of the Boards. It should be borne in mind, however, that the Bureau quotes dealers' wholesale selling prices, while the Board prices represent more nearly what is paid the factories. There is, therefore, a margin of difference between the two prices to take care of dealers' handling and selling costs.

As current receipts show up better, it will become more difficult to move goods which are not fancy, for storing interest is centered wholly on good quality cheese, and there are still those who have poor quality stock from last year on their hands, on which they now are absorbing losses. There has been considerable export buying at New York at around 14c, but with buyers now offering only 13c this business is expected to slow up temporarily.

The average wholesale prices on American cheese (style Twins) for the week ending May 28, 1921, and for the corresponding week a year ago were as follows:

	Week ending May 28 1921	1920
	Cents	Cents
New York	16.00	30.50
Chicago	14.50	27.41
Boston	16.00	30.91
San Francisco	14.42	24.96
Wisconsin	13.96	26.83

The receipts of cheese at these markets were 4,732,636 lbs. as compared with 3,597,695 lbs. a year ago and 4,346,314 lbs. a week ago.

New York Butter Market

New York City, May 31:—The strike of the porters and truck drivers which was a protest against a reduction of wages and against the open shop is now virtually settled with the union men completely defeated. The strike was not so much against the wage reduction but against the principle of the open shop. It was apparent from the outset that nothing could be gained by the strike and there was no question regarding the outcome. The Industrial Relations Committee of the New York Mercantile Exchange handled the situation very competently and little confusion resulted from the strike. At no time were the strikers unruly as ample production was given the market section by the police and by private detectives who were employed to assist in breaking up the strike. Many of the strikers were refused employment when they wished to return to work and are now seeking employment elsewhere. The principle of the "open shop" now seems to be completely established in this market.

During the strike considerable quantities of butter accumulated at railroad terminals and wharves which necessitated much re-icing. With the calling off of the strike, the greater part of that butter was unloaded which made today's receipts quite heavy, the aggregate being in excess of 15,000 packages. However, the butter is being rapidly absorbed as much of it is being moved direct to storage warehouses, some is being put away by receivers for their customers and there is considerable open speculative buying. On the whole there is encouraging activity in the market. While prices have scarcely varied during the past week, butter has moved freely and the general tone of the market is the best that it has been for several months.

The quality of the butter being received is much higher than it has been for several years. It is quite apparent that creamery operators remember the trying conditions of the past year and have made active efforts to improve the quality of their product. This is especially true of the centralized butter that is coming to this market. The arrival of a small shipment of Danish butter during the past week illustrates why it pays to produce fancy butter. The 300 casks of Danish butter that were received were sold to dealers at a price of 1c above the extreme top quotation for our domestic butter. It undoubtedly is true that an active market will be worked up for Danish butter in spite of the fact that a higher tariff duty is now levied on imported butter. Fancy trade demands high class butter and is willing to pay high prices for it.

There is a feeling in the market that the prices which prevail at the present time will remain fairly constant during the month of June. Very little butter, comparatively speaking, has been placed in storage as yet and great quantities must be stored during the coming month or there will be a shortage of supply during the fall and winter months. There might be an upward trend to prices during June but for the fact that production is at high point and will continue large during the coming two months. While census statistics show a reduction in cow population of practically one-half million animals, there seems to have been a culling out of the poorer stock with the result that actual production is somewhat above normal. Centralized creameries report an actual gain in butter production of about 30%.

On Tuesday of last week, extras were quoted at 28½c. On the following day the price advanced ½c, since which time there has been no price changes of consequence although there has been a slight variation in quotations on undergrades. At the close today quotations are as follows: Extras (92 score), 29c; higher scoring than extras (93 score or higher), 29½@30c; firsts (90—91 score), 27½@28½c; firsts (88—89 score), 26@27c; and, seconds (83—87 score), 22@25c. W. B. LIVERANCE.

Steadier Butter Markets

(Report by U. S. Bureau of Markets)

During the week ending May 28 butter markets were more active. Demand was chiefly for the finer grades of creamery and for fine centralized cars, but a notable thing about the market was the way in which undergrades, including even off-grade lots, were absorbed on most markets. Prices on these grades were low of course, but were closer than the usual range. The rather easy placing of this sort of butter is further proof of the good consumptive demand. Cheap butter is proving a strong competitor against butter substitutes.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending May 28, 1921, and the corresponding week a year ago were as follows:

	Week ending May 28 1921	1920
	cents	cents
New York	28.83	60.00
Chicago	28.00	53.46
Philadelphia	29.92	60.33
Boston	29.50	57.91
San Francisco	31.33	51.50

The receipts of butter at these markets were 14,853,590 lbs. as compared with 9,734,128 lbs. a year ago and 14,930,239 lbs. a week ago.

Cheese Prices for May

Cheese prices during May took a further decline of about 4c on both Twins and Longhorns. The daily quotations of the U. S. Bureau of Markets show the following average prices for American cheese (style Twins) for the three large markets in May, 1920 and 1921:

	Average price May 1921	May 1920
	Cts.	Cts.
Wisconsin Boards	14.22	24.96
Chicago	14.45	25.28
New York	16.22	27.88

Longhorns averaged 14.21c on the Wisconsin Boards as compared with 29.5c in May a year ago.

CHICAGO, June 3—Butter—Creamery, extras, 28c; standards, 28c; dairy, firsts, 22@26c; seconds, 17@22c.

Eggs—Ordinary, 18@19c; firsts, 21¾c.

Cheese—Twins, 14c; Young Americas, 16c.

SHEBOYGAN FALLS, Wis., June 1—Cheese—On the Wisconsin cheese exchange at Plymouth on Tuesday twenty factories offered 4,850 boxes of cheese. All sold as follows: Three hundred fifty Twins at 14¼c; 3,300 Daisies at 14c; 400 Double Daisies at 13¾c; 100 do at 13¾c; 50 cases Young Americas at 14c; 625 cases Longhorns at 14c; 25 boxes square prints at 14c. These prices compared with a week ago show an advance of ¾c on Twins, 1½c on Daisies and squares, 1¾c on Double Daisies, 1c on Young Americas and Longhorns.

No. 1 rye straw—New York $24, Philadelphia $18, Pittsburgh $16, Cincinnati $18, Chicago $15, Minneapolis $9.50.

"It Milks the Cows Clean"

The Burrell Automatic Controller

IT IS obvious that an easy milker requires less suction in the teat-cup than a hard milker. It is equally plain that less suction is required during the main part of the milking, when the milk flows easily, than toward the end of the milking.

The Burrell Automatic Controller, as the name implies, is a unique device for automatically regulating the suction to the amount required to keep the milk flowing freely. It has been a feature of the Burrell Milker since 1910 and is largely responsible for the satisfaction that the Burrell Milker has given and the reputation of the Burrell that *"It Milks the Cows Clean."*

The Burrell Automatic Controller is so constructed that the vacuum cannot exhaust the air from the teat-cup as quickly or as completely when milk is flowing freely as when little or no milk is flowing. In other words, with the easy milker or during the main part of the milking, when milk is flowing freely, the suction in the teat-cup is automatically reduced; while with the hard milker or toward the end of the milking, when milk is flowing less freely, greater vacuum suck is applied in the teat-cup.

An important feature of the Burrell Automatic Controller is that this balance between the amount of milk flowing and the amount of suction in the teat-cups is secured without any change in the speed of pulsation, which must always remain constant.

There are other exclusive Burrell features that you should know about—the Burrell Positive Relief Pulsator, the Burrell Universal Teat Cup, and the Burrell Moisture Trap.

Write today for our booklet and complete information. Tell us how many cows you milk and why you are not already milking by machine. Use the coupon below.

How to know good Roofing—

THERE is one sure way to select good roofing. It never fails. *Look at the label before you buy!* If it reads "Barrett Everlastic" you are perfectly safe. You are sure of a moderate priced roof that will give many years of satisfactory service—a roofing backed by a company with sixty years of "know-how."

It isn't necessary to rip off the old roof when you use Everlastic Roofings. You can lay the new roofing on top of the old and get a first-class job.

There's a style of Everlastic for every steep-roofed building on your farm. In roll roofing, you have a choice of two styles—one plain-surfaced, another handsomely coated with red or green crushed slate. There are also two styles of Everlastic Shingles, one single and one in strips of four—both surfaced with crush slate in the attractive natural shades of red or green.

Everlastic "Rubber" Roofing

This is one of our most popular roofings. A recognized standard among "rubber" roofings. Famous for durability. Made of high-grade **waterproofing** materials, it defies wind and weather and insures dry, comfortable buildings under all weather conditions. Tough, pliable, durable and low in price. It is easy to lay, no skilled labor required. Nails and cement in each roll.

Everlastic Slate-Surfaced Roofing

A high-grade roll roofing, *surfaced with genuine crushed slate*, in two natural shades, red or green. Needs no painting. Handsome enough for a home, economical enough for a barn or garage. Combines real protection against fire with beauty. Nails and cement with each roll.

Everlastic Multi-Shingles
(4-Shingles-in-One)

Made of high-grade thoroughly waterproofed felt and *surfaced with crushed slate* in beautiful natural slate colors, either red or green. Laid in strips of *four shingles in one* at far less cost in labor and time than for wooden shingles. Give you a roof of artistic beauty worthy of the finest buildings, and one that resists fire and weather. Need no painting.

Everlastic Single Shingles

Made of the same durable slate surface (red or green) material as the Multi-Shingles, but cut into individual shingles, 8x12¾ in. Laid like wooden shingles but cost less per year of service. Need no painting.

Booklets fully describing each style, free on request

Plan of Milk Marketing Organization

(Continued from page 847)

the value of each share is $100 a certain number of milk producers will subscribe. Later on terms of payment can be given and those who would have subscribed at the lower par value will subscribe at the higher par value when terms of payment are given. Milk producers soon learn to understand that a $100 investment for marketing their farm products is very small as compared with the investment in production.

The securing of the stock is done systematically. The county farm bureaus co-operate. Just previous to the stock soliciting the farm adviser or county agent plans and advertises advance meetings of milk producers. Local farm leaders and leaders of the stock selling force explain the purposes and plans of the marketing association.

Insofar as possible all plans for the soliciting are perfected at this meeting. The routes are laid out; the names of milk producers on each route are listed; the names of auto drivers for the solicitors on definite dates are secured; and the solicitors or canvassers are then fitted in to this program. The driver is a local man. The solicitor with him is a farmer and experienced in canvassing and represents the Illinois Agricultural Association. Our solicitors sold over $200,000 worth of stock and secured more than 3,000 five-year milk contracts in about two months' time.

There should be ample money with which to secure well-equipped plants for receiving, weighing, and testing all of the milk and for handling and manufacturing the surplus milk without going into debt. The psychology of the marketing organization is largely shaped around the finances. If an organization is in debt, if its credit is poor, if the meetings of the directors and stockholders have to be devoted chiefly to figuring out some way of raising money for meeting certain deficiencies, and if the milk producers cannot receive their full pay promptly, the work of the organization is generally handicapped, and much difficulty will be experienced in making contracts for the sale of products.

There is nothing so effective in dampening the interest in any organization as to be financially distressed It is a mistake to promote a business and then trust to loyal support of milk producers and good luck to finance it. Finance the enterprise first, and then invest according to immediate needs and according to the purse, and always have a "nest egg" left. If the annual report to the stockholders can show that property is paid for, and that there are several thousand dollars in the treasury, the psychological effect is good. Nobody cares to have anything to do with an organization that is always financially embarrassed. Such an organization has difficulties in securing a good board of directors, good management, and to secure enthusiastic support from the patrons and stockholders. On the other hand, if the finances are in good shape and some reserve on hand, an atmosphere of interest and enthusiasm permeates the entire organization. In planning for a marketing organization there is nothing more important than to provide for ample financing and then select conservative management who will not promote beyond ability to pay and beyond ability to keep proper records of all transactions.

milk producers to market milk through the organization for a term of years. If possible, the marketing company should secure contracts to handle not less than 80 per cent of the milk in the tributary territory. This means not less than 80 per cent of each and all shipping points, and not 80 per cent of the milk in the territory.

Our experience has been that it is easier to secure milk contracts than it is to secure the stock subscriptions.

The marketing company should have the selling of sufficient milk so as to supply the dealers with all milk needed by them. A total supply contract rather than a pound contract should be secured from the dealers.

Without quantity of milk the selling power is diminished and may even be paralyzed. The buying power of the dealers is usually united. To make the law of supply and demand act fairly, the selling power of a milk marketing organization should be about on the level with the buying power of the dealers. This cannot obtain unless the marketing association actually has the sale of about 80 per cent of the milk produced in the tributary territory.

Well Equipped Surplus Plants

Fourth, the plans also provide facilities for handling and manufacturing the surplus milk. So far, the plans have provided only for manufacturing butter and cheese and for the sale of sweet cream. It may be necessary to include the manufacturing of condensed milk and ice cream and even powdered milk. When a milk marketing organization begins to manufacture surplus milk, it is considered safer to manufacture the more staple and standard products, such as butter and cheese, and to sell sweet cream to ice cream manufacturers.

To equip for manufacturing condensed milk, powdered milk, and ice cream is expensive, and the details of manufacture are more numerous and more vital. A high type of sales organizations is also required. Both of these conditions do not fit in well with the operation of a newly organized co-operative marketing association.

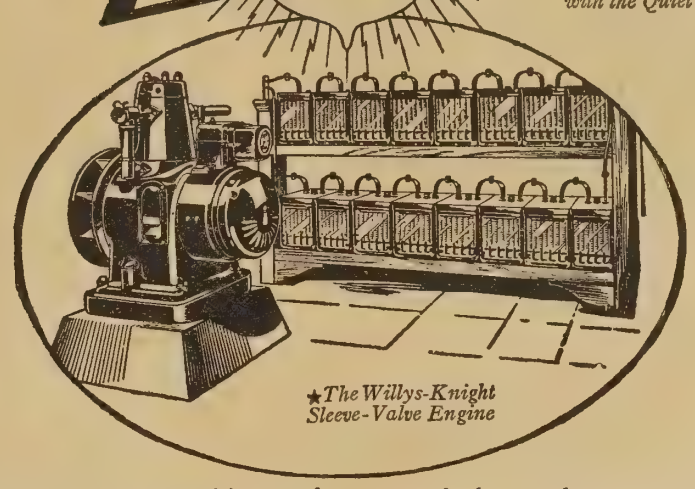
The surplus milk can be manufactured into a very high quality of butter and cheese which will demand the highest possible price. High quality should be the watchword of any milk producers' marketing association.

When enough of this high quality product is manufactured, a special market may be created and the co-operative selling of the various marketing associations on the terminal market should prove profitable.

It is very important that these surplus plants be located so as to serve the greatest number of milk producers and the largest volume of milk and not located according to the "pull" of certain directors of the marketing company.

If the milk producers will co-operate, they will back the marketing program with money; if they will hire the best of management and produce and manufacture high quality of products, I see no reason why the co-operative milk marketing plan should not be a great improvement over the old individual uncertain method of marketing milk.

Feeding Silage



HOARD'S DAIRYMAN:—May I make a practical suggestion in these news notes on methods of feeding silage during the summer months? In a recent issue of Hoard's Dairyman, you advise feeding off one-half of the silage at a time, either losing the silage on top of the other half or saving somewhat by covering with tar paper, canvas, wet straw, or other material. Here is a method that I myself have found desirable: Start feeding from the front of the silo and feed the silage down two or three feet. Then throw the spoiled silage from the back half over the good silage in front and tramp it down thoroughly, wetting if necessary to make it pack. Then feed the back down until it is two or three feet lower than the front. Then throw back the same spoiled silage as was transferred in the first place and keep on with this practice until the silo is empty. This reduces spoilage to a minimum.

Ontario. F. E. ELLIS.

Uncle Ab says that the man who helps to scatter sunshine never stays long in the shadows.

Willys LIGHT

Power and Light with the Quiet Knight★

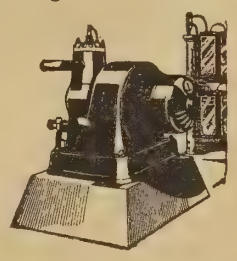
★*The Willys-Knight Sleeve-Valve Engine*

THERE could be no better evidence of keeping faith with the public than this—to share our ability to produce quality products on a quantity basis with everyone in North America who needs electricity.

In the famous Willys Light we have swept aside precedent and given every home the benefit of bed rock quality at rock bottom prices.

At its present low price of $525 there can and will be no further reduction. Already we are meeting the farmer more than half way—giving him the great advantage of a practical, complete power and light plant, backed by national resources and service, at an unheard-of price.

This wonderful reduction in price is no more extraordinary than the wonderful service Willys Light is giving hundreds of homes.



The famous Willys-Knight engine is only one exclusive superiority, in addition Willys Light has fifty distinct advantages. These combined with its new low price warrant your immediate action. See your nearest Willys Light dealer or write for booklet.

Willys LIGHT JUNIOR

$295

—And here is the Electric Plant that will revolutionize farm lighting—Willys Light Junior. Somewhat smaller but in every other respect measuring up to Willys Light quality, this plant is big enough for lights and small power uses. At this low price, you can now have the electricity you have been waiting for.

Willys Light Junior has the wonderful Auto-Lite engine generator, a battery of ample capacity and is of standard voltage.

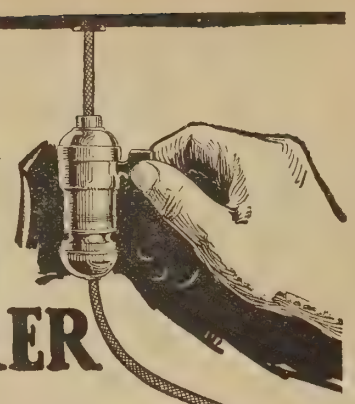
Sturges Steel Churns

A Low-Cost Scientific Equipment For the Farm Dairy



Just because the creameries can't get the sweet, rich, high-test cream which alone can make the best grade of butter, they lose, and the farmers lose, several millions of dollars a year. This is a fearful price to pay for dirt and sourness caused by careless, insanitary methods in the farm-dairy.

CHERRY BULLETIN 1005 C describes inexpensive equipment that will permit the small producer to deliver to his creamery as "fancy" a grade of cream as the millionaire "gentleman farmer" produces.

The Bulletin is free. Ask for it.

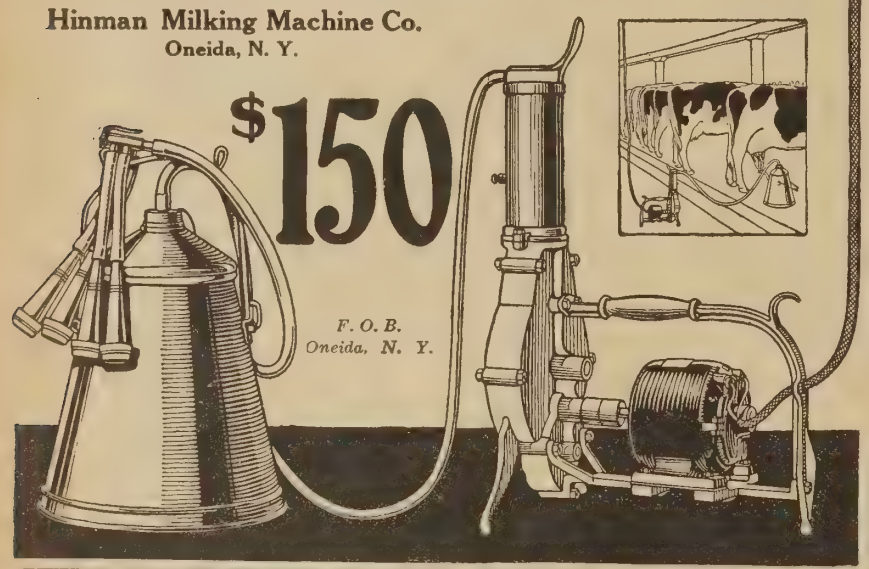
A Turn of the Switch Starts the HINMAN ELECTRIC MILKER

Here is a sturdy, compact, simple little machine that marks an epoch in the evolution of American dairy practice.
"Milking cows by electricity"—the dream of every dairyman and helper who has ever drudged and sweat and worked twice daily under cows—is now an actual, demonstrated fact.

Light Weight—Extremely Simple

The Hinman Electric embodies all the tried and proved principles of the famous Standard Hinman Milker. It consists of motor, reduction gears and pump in one light, compact unit, and the well-known "valve-in-chamber" and pail in the other unit.

It is ideal in its simplicity. Requires no installation. Connect the cord to electric light socket, turn on switch, attach teat cups and you are milking.



The power unit is a 1-6 H.P. Genera Electric Motor coupled to enclosed, quiet running gears that run a rigid pump of Hinman design. Pump has automobile type piston, connecting rod and bearings and Hinman relief valve. The entire unit is so light and so simple as to be easily operated by twelve-year-old boy. Motors furnished for any current.

Get the Facts—See a Machine

If you have electricity and keep cows, by all means get the facts. The Hinman Electric is designed for dairies of any size—one cow or more. If you do not have electricity, get the facts about the Standard Hinman Milker.

Literature and information is free. Send for it today.

Washington Calf Clubs

HOARD'S DAIRYMAN:—Forming dairy calf clubs among boys and girls has become almost as popular in Washington as organizing cow testing associations, which is saying considerable, for there is a veritable revival of interest in these effective checks on the production of the herd. Apparently the reviving interest of adults in making the dairy pay has had its effect upon the youngsters, or perhaps it is vice versa, but at any rate both boys' and girls' dairy clubs and cow testing associations are being formed, in several instances, in the same counties or communities.

In Jefferson County, in the Chimacum community, the Holstein breeders had hardly completed the organization of a pure-bred bull association before the youngsters were out with plans for a pure-bred Holstein heifer calf club, "to demonstrate and teach dairy principles, stimulate property ownership, and encourage interest in pure-bred cattle; to demonstrate the building of a pure-bred herd from one cow; to show the value of co-operation in the use of meritorious sires; and to develop leaders among the boys." County Agricultural Agent R. J. McKenna helped them organize, and Dan Yarr, one of the leading Holstein breeders of the county, has agreed to act as leader, to meet with them and advise and assist them where necessary. They will meet regularly to check records and to discuss matters of interest. The boys who "belong", several of whom have already provided themselves with heifers, are John Nisbet, Elmer Cook, John Broderson, Steve Bishop, Chas. Broderson, Arthur Cook, Thomas Yarr, Floyd Tucker, Wilbur and Walter Bishop and Charles Twiggs. The community is well known for its dairying, and co-operation has proved successful there.

Walla Walla County, which ranks low in number of dairy cattle raised but high in possibilities for development, has a dairy calf club that promises to become the largest in the state. County Club Leader F. L. Shannon and Ralph H. Tuttle, president of the county Holstein-Friesian Association, have already imported and distributed one carload of pure-bred black and whites, and they expect the demand for others to necessitate importation of two more, probably mostly Holsteins. J. H. Compau, dairy project leader of the county farm bureau, has assisted, as have also W. F. McCormick, G. Weerda, and Charles Baker, local breeders. Membership in the club is limited for the most part to boys and girls from families which own their farms. There must be five in a group to make it a standard club, but beyond these requirements the only one is a love for stock and a desire to raise at least one pure-bred heifer. The Walla Walla country has been devoted largely to alfalfa and wheat raising and to beef cattle, but with all three of these lines hard hit by unfavorable conditions of the past two or three years, dairying is coming to be regarded there with much greater favor.

Representative Lew Hubbard and Warren Lincoln, a pure-bred Jersey breeder, made it possible for four boys in Thurston County to have a Jersey calf apiece and to organize a club at Yelm. The former took the boys' notes for one year at 6 per cent for the purchase price of the calves, which Lincoln had made as low as possible to help the thing along. The delivery of the calves was made a gala occasion, and 100 people turned out. County Club Leader W. H. Dunham and Dairy Project Leader D. R. Hughes of the farm bureau advised the boys to care for their property, which are aristocratic descendants of Sophie 19th of Hood Farm. Members of the club are Howard B. Meyer, Geo. W. Cozens, Chester F. Royse, and LaFayette J. Parker. It is the first to be organized in Thurston County, where a cow testing association has also been formed recently to co-operate with dairymen of adjoining Grays Harbor County in testing cows.

Washington. G. N. ANGELL.

Wisconsin Holstein Breeders' Northern Sale

The primary purpose of the Wisconsin Breeders' Northern State Sale held at Marshfield, Wis., May 26, was to offer high class foundation Holsteins with the expectation that they would be purchased largely by Central Wisconsin breeders, and in this respect the sale was successful.

Bidding, however, was slow from the start and had an outside buyer been in attendance he could have secured some excellent bargains.

R. F. Weymouth purchased the top priced animal for $535. This was a 1,150-lb. 3-year-old grandson of Friend Hengerveld De Kol Butter Boy consigned by Albert Zenzel and Wachsmuth Bros.

A 29.99-lb. 6-year-old cow with 690 lbs. milk in 7 days topped the females at $510. She was consigned by Geo. I. Sassman and purchased by R. F. Clark. The entire 59 head brought $16,020.

Mack, Krause, and Clark did the selling with Everson in the box.

Following is a list of those animals bringing $300 or more and buyers of same:

R. F. Clark, Wisconsin	
Pauline Hengerveld Julip	$510
J. H. Reed, Wisconsin	
River Valley Ormsby	$300
F. G. Lehman, Wisconsin

R. F. Weymouth, Wisconsin	
Producer	$535

Ayrshires in California

Shasta County, situated in the upper end of the great Sacramento Valley of California, with its fertile river bottom lands under irrigation and surrounded by foothill ranches watered by mountain streams, is undoubtedly destined to be one of the greatest dairy counties of the Union when its people awake to its possibilities, which they are fast doing.

Two years ago no one would talk cows; each had his own get-rich-quick crop to grow. Now the same man is planting alfalfa and seriously thinking cows, while the newcomers, who are fast absorbing the surplus irrigated lands, invariably tell you that as soon as they can get alfalfa started they intend to dairy.

Wyndham's Dairy, realizing some years ago that this was an Ayrshire county, started to build up a grade herd by the use of bulls from high producing families and also got one pure-bred heifer, but unfortunately most of her calves were of the wrong sex. However, enough heifers matured to prove to Mr. Wyndham that he was on the right track, so he sold a number of grades and replaced them with a carload of pure-breds from Canadian herds. Mr. Wyndham was determined that each cow should not only have good conformation and have made at least one creditable record production under ordinary farm conditions, but should have size and good sized teats. Among his selection is "Aaggie of Darroch", secured from the Angus Armour herd in Ontario, who was grand champion in Ontario in 1918, and in five years averaged over 11,000 lbs. of milk on twice a day milking; and Princess 4th from the Woodisse Bros. herd, who secured the silver cup in 1919 in her two-year-old form with a record of 10,765 lbs. of milk and 453 lbs. of butterfat on twice a day milking and running with the rest of the herd. These two cows, with others in the bunch, which have been milking several months are milking 40 lbs. each daily, though they have been less than a month in their new home. This herd should do a lot toward popularizing the breed in the West, where it is so little known, and give the dairymen of the district an opportunity to put bulls of the right kind at the head of their herds.

New England Ayrshire Club

A special meeting of the executive committee of the New England Ayrshire Club was held in Boston May 6. Several plans were fully considered and unanimously adopted, the object of which is to develop a wider field for Ayrshire cattle in New England.

Arrangements were made with the Live Stock Improvement Co. Inc. of Massachusetts, as submitted by Joseph Ray of Franklin, whereby pure-bred calves can be placed with farmers in New England at a nominal cost, payment to be made in interest bearing stock of the Live Stock Improvement Co. Inc.

A report of the treasurer indicated a substantial surplus of cash on hand, nearly all of the dues for the current year having been paid. Several applications for membership previously proposed were confirmed and steps were taken to further increase the membership by inviting former breeders of the Club to renew membership again.

A vote was taken, authorizing a prize of $50 for the highest production in milk of any two-year-old heifer, bred and owned by any member of the Club, said contest to commence on or before December of this year, and due notice giving full conditions will be sent shortly to the members. There is already in the possession of the Club a fund that was given for this purpose by A. B. Marble, a former president. The committee also voted to appropriate $120 to be distributed at the rate of $20 each to six fairs.

It was decided to hold two fieldays this summer; one for the benefit of the members located in the northern sections of New England, and the other at a point that would be convenient for the southern members of the Club; and an invitation was accepted which was presented by Mr. Blondin, superintendent of the farm owned by Walter M. Parker at Auburn, New Hampshire; this fieldday to occur during the latter part of June.

The secretary was instructed to obtain information bearing on the number of breeders of Ayrshire cattle in New England and also the number of actual animals that are owned. A discussion was had in regard to the advisability of holding a sale under the auspices of the New England Ayrshire Club for the purpose of aiding the members in marketing their animals, and it was thought inadvisable to consider the sale at the present time, but arrangements are to be made to plan on a sale in the future.

A publicity committee was elected and special instructions were given to carry on an extended advertising campaign. Arrangements were made to publish literature bearing on the merits of the Ayrshire cow, together with a copy of the revised by-laws and a program for the future.

Considerable enthusiasm was displayed and much interest was shown in the future plans of the Club to develop its influence and assist the interests of the membership.

Massachusetts. WM. HANDY, Sec.

Pure-Bred Cattle in Georgia

The census bureau reports a total of 8,727 pure-bred dairy cattle in the state of Georgia, 7,033 of these being females. The totals by breed are as follows: Fourteen Ayrshires, 305 Guernseys, 1,700 Holsteins, 6,224 Jerseys, and 484 of other breeds.

A little planning will usually let you and the family take in the farmers' and community picnics. As promoters of neighborliness they are too valuable to be missed.

Primrose Prices Down!

Go over these Primrose details again —then see the International dealer

PRIMROSE is the only cream separator with two wide-open cream outlets that are never restricted in size. The regulating screw is in the skimmilk outlet. It is easy to adjust because it works on the large volume of skimmilk instead of on the small volume of cream.

In the Primrose, oil is forced through the bearings and not just to them.

It is the only separator in which the dirty used oil is turned out automatically when new oil is poured in.

Primrose separators run easily and steadily, skim with exceeding closeness, and serve their owners reliably for many years. Direct power drive and electric motor drive equipment available. Built in four sizes with capacities ranging from 350 to 850 pounds of milk per hour.

Primrose quality may now be had at lowered prices. Take advantage of Primrose lower price at the stores of the International dealers.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Junior Hay Makers

While every junior has his own interests in the things of the farm, there is always the interest that goes with the general work that is necessary to operate the farm successfully. To know how to do certain things is a very important matter for farm boys but to know the reasons is a matter of quite equal importance, for the why of a thing usually determines to a large extent how it is done. Most junior farmers will be engaged in helping to make the beautiful meadows of clover and alfalfa that we now see into hay before long, and so we think that every junior should know some things about the fundamental principles upon which the making of good hay depends. The big task in making hay is to get the job done, but we should not lose sight of the fact that we want to make the best kind of hay that it is possible to make.

If you ask dad what the best kind of hay is, he will probably tell you that good hay has a bright green color, smells good, and has most of the leaves left on. This would indeed be a very good answer and whenever you see hay that has all of these qualities, you may know that it has been properly made. Now of course you may well ask how should clover and alfalfa be turned into hay so that the very best kind is had.

First of all we must determine when the crop should be cut, and to know when to do this we must keep some fundamental things in mind. To be sure we want to get the largest yield possible without sacrificing some of the other qualities that good hay should have. Therefore as a usual thing we allow the crop to make a large growth before cutting it. Clover is cut when in full bloom or just as some of the heads are beginning to turn brown. By this time there is just about as much dry matter as there will ever be and if we wait longer than this stage before cutting, the hay will not be as good because the stock will not eat it as readily.

Hay to be first class should be palatable. Cattle will digest it more efficiently and there will not be so much waste. Furthermore, if we waited much longer than this stage, many of the lower leaves would begin to fall off and then we would not get as much hay. In the case of alfalfa especially, we must also keep in mind the effect of cutting the first crop upon the growth of the second. We perhaps all know that when the new shoots are appearing at the crowns of the plants that will make the second crop, then it is time to cut the first one. If we wait much longer than this the new shoots will be clipped off and this will cause the second crop to make a slower growth. So here are three things that should govern us in making hay. First, we must get the biggest yield that is possible; second, we want to take the crop when it will make a palatable hay; and third, the effect upon the second or next crop should be considered. And while these are all very important, we should not lose sight of some other factors.

Hay furnishes starches, proteins, and fats for the stock in addition to those furnished in the grains they eat. And in order to become of any use in the animal body, they must be digested. At some stages in the growth of plants these food compounds are more digestible than at other times. Now, of course any farmer wants all of the digestible protein he can get in his hay. Usually the older plants become, the more woody they get to be and the less digestible they are when eaten by the stock. Our problem then is to get a large yield of palatable hay containing the greatest amounts of digestible foodstuffs. In clovers, this time comes when the plants are just ready to begin to fade their blossoms and in alfalfa, when the new shoots that make the next growth are starting upward from the crowns of the plants. These facts are the guiding principles of hay making with reference to the best time to take the crop for hay.

And now the task of making good hay! If you would weigh 100 lbs. of the green clover just as soon as it is cut down and then when it is fit to place in the stack, you would find that there has been a decided loss in its weight, in fact to be quite exact you would probably have about 30 lbs. of hay. This means that there has been considerable shrinkage during the drying process and we believe that every farm boy knows that this has been due to a loss of moisture. And right here is a very interesting and practical problem dealing with this very matter of making hay. Let us suppose that you have 5 tons of hay with a moisture content of 20 per cent. Can you figure the tons of green clover that it took to make it providing 75 per cent of its weight was moisture? Perhaps some of you will send in the answer the next time you write to us. This problem brings out a very important point in hay making. It is safe to say that from 60 to 80 per cent of the weight of the green clover or alfalfa is moisture and in order to make hay from it that is fit to stack or store away in the barn, this moisture content must be reduced to about 20 to 25 per cent. This is the chief thing that goes on when dad talks about curing or drying the hay. But this isn't all either. Did you ever notice what a fine odor comes from a mow of newly made hay? This helps to make the stock like it and we speak of it as the aroma of the hay. It disappears as the hay gets older and hay that has been very wet also loses its aroma.

One of the greatest difficulties in hay making is to save the leaves. If it is allowed to get too dry, they are bound to break off with the handling. In order to avoid this, hay should not be allowed to dry in the swath. If it is, the leaves get scorched and become very brittle. Some people make this mistake and then they have a very poor quality of hay, for with the loss of leaves there is a great loss in the feeding value. Dad probably has lived through the days when more of the hay was cocked up in the field to dry than it is today. When one starts to make hay nowadays he likes to do it as fast as possible because he usually has a great deal of it to make, and cocking it all up means a lot of extra work. With the improvement in haying machinery, we are able to work more rapidly and so now we do not see so much of the hay cocked in the field. If the weather is good, it is a good plan to allow the hay to remain in the swath long enough to become thoroughly wilted. This is called a partial drying in the swath. Then it should be raked into windrows and allowed to complete the drying process. If it is not allowed to get too dry before raking, a very good quality of hay can be made in this way, and thus the labor of cocking it up has been saved.

We often hear dad say, "Well, I guess we can haul hay tomorrow if the weather is fine," and we wonder how he knows. You never saw him determining in any mathematical way how much moisture was in the hay, did you? Of course you didn't! But he knows from experience, and he can tell by the feel of it. While there isn't any real set rule that he goes by, still there are some pretty safe guides that make him reason as he does. For example, if it feels cool when he touches it, and if he cannot wring out any moisture by twisting a bunch of it, it is ready to haul in. But if an actual moisture test was made at this time, you would probably find that it contained from about 15 to 25 per cent of moisture.

And did you ever stop to think that hay soaked with rains is not as good as that which has not been wet? Getting wet does several things that reduce the quality of the hay. First of all, it loses its color; and hay that has lost the bright green color it should have is not hay of first quality. Then, too, it has actually lost some of its weight. Scientists who have studied this problem state that the loss may be as great as 30 per cent. Dad knows that wet hay has its quality reduced and that is why he is so anxious to get all of his hay in before it gets wet.

Then there is another thing that it might be well for you to look into before leaving this study. Suppose your father puts away fifty tons of hay this season. Do you think that he will have the same amount by next winter? We can say from experience that he will not, because there is always a natural shrinkage in stored hay. Usually this amounts to about 7 to 15 per cent of the original weight and it is largely due to a further loss of moisture. Here is another sensible problem based upon this fact. Assuming that hay is worth $10.00 a ton when it is fit to haul from the field and allowing that it will shrink 10 per cent in the stack or mow, what should it be worth in March at this rate, providing no other factors are considered?

And do you know how to measure hay in the mow? Here are some pretty safe rules in regard to that matter. For clover hay in the mow after it has settled, it will take about 500 cubic feet to make a ton; for timothy, about 420 cubic feet; while for mixed hay, about 450 cubic feet. Knowing these facts, together with the dimensions of the mow and the depth of hay in it, one can easily figure the amount of hay he has.

DAIRY CATTLE JUDGING CONTEST AT BOYS' AND GIRLS' "CLUB ROUND-UP", PURDUE UNIVERSITY, INDIANA, MAY 3RD TO 6TH

Junior Letters

Hoard's Dairyman Juniors:—I received my fob, button, and creed. We own a farm of 80 acres. Most of the people around here run claims. We run a dairy. It is a fine job. We own 5 calves, 11 cows, one bull, and two horses, and I own one calf and fourteen chickens.

Virginia. Hayden Jones.

Hoard's Dairyman Juniors:—This season is rather behind because we have had so much rain and freezing weather. Some ground is not plowed and very little corn planted. It is going in fast from now on.

We have 75 acres rented, some in pasture and some in plow land.

Grandma and we have our cattle together. She has three. Kenneth, that's my brother, and I have three and father has a calf. Father has two horses and three pigs now. One of the cows is registered and the rest are grades. All of the stock is named. The cows begin with A and go down the alphabet. We are farther down the alphabet than seven letters because we have sold some.

Kansas. Warren Thurston.

Hoard's Dairyman Juniors:—I have been reading the junior letters and like to read them. My father has four grade cows, one heifer and three calves.

I am in the 6th grade at school and am 12 years old. We have one Fox Terrier female and 2 puppies. The female's name is Waynie Girl. We haven't named the pups yet. We also have nine hundred little chicks and 200 White Leghorn hens. We have 3 incubators that hold 940 eggs.

I wish the juniors good luck.

Missouri. Louis H. Diehl.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I am 10 years old and in the 6th grade at school. I go to the Mulberry Grove School. I have about one mile to go. My teacher's name is Mrs. Nora B. Ellis.

We have 5 Holstein cows and 3 calves which are all Holsteins too. We also have 3 horses. One of the calves is mine and I call her Retta. We have about 200 chickens and get from 12 to 15 dozen eggs a day. We live on a 40-acre farm which we rent. We have two geese.

I wish all of the juniors good luck.

Illinois. Nina Johnson.

Hoard's Dairyman Juniors:—I am 14 years old and in the 6th grade.

We have 8 work horses and one little driving horse and two little mules about one year old. We call them Abraham and Isaac. We bought Isaac and raised Abraham. One day Abraham kicked me under the right eye and

knocked me over and then he ran away with his head in the air.

We have about 68 head of cattle. We are milking 25 cows and shipping 10 and 11 cans of milk a day. Most of our cows are Holsteins. I milk four cows every night and morning.

I have three brothers older than I and two younger.

We have about 30 pure-bred Chester White pigs.

We have the White Orpington chickens.

If any of the juniors wish to write to me my address is Burdick, Indiana.

Harold C. Gring.

Hoard's Dairyman Juniors:—We have taken Hoard's Dairyman for some years and like it fine, always glad when it comes and it sure has a good reputation.

We live on a five-acre ranch. Suppose that sounds very small to the juniors, but that is all that people have where we live and some only have one-half acre and one acre. But the majority have about four or five acres. We have one very nice Jersey cow. She is very nice and gentle. She gives about four gallons of very rich milk when fresh. Our school will soon be out. I will be glad for in summer I go swimming at a nearby lake called Oswego Lake. We have lots of fun down there. I suppose many of the juniors get to see the Great Lakes real often. The weather here in Oregon is beautiful now. Everything is so pretty. Many wild flowers are out. Another girl and I went picking them. Had lots of fun and gathered a good many.

We have 6 chickens that lay fine. We get 4 to 6 eggs every day. We did have a great many of them, but as feed became so high priced had to sell them. I also have one little rabbit that I call Peter. We have five nice goats that have lots of woolly fur and that will soon be sheared after cold nights go away.

My birthday was April 12 and I got a pretty card and barrett, also box of writing paper and one box of pretty handkerchiefs. I had a pretty white cake with 13 pink candles on it. Had a fine time.

I hope to hear from some of the juniors. My address is R. 1, Oswego, Ore.

Dorothy Lawson.

Hoard's Dairyman Juniors:—Received the fob, button, and creed, with which I was very much pleased and I thank you very much. When my brother saw them he was real interested in the club and soon joined.

We planted our strawberries a few days ago and they are doing fine. The grain is now above ground.

I have four ducks and eight small ones. I also have three hens setting on duck eggs.

We are planning on planting a large patch of potatoes this year. My brother raised about an acre of beans last year and found them profitable so we intend to raise more this year.

We moved our raspberry patch this year and also planted some more gooseberry and currant bushes. We are breaking up our pasture this year and there is a lot of fencing to do.

I have a horse, buggy, and harness of my own. The horse's name is Bell. She is broke single, double, and to ride. I have no saddle but still I enjoy riding.

Wishing the juniors good luck and also some of them to write to me. My address is R. R. No. 5, Blooming Prairie, Minnesota.

Donald McNerney.

Hoard's Dairyman Juniors:—I believe I told you we had thirty head of cattle, but now we have thirty-seven, one of which was born tonight; he is a bull. We have had three bulls out of four calves. There are five or six more to calve soon or within two months. We are milking seven cows. I milk them all.

We have four brood sows. Two have pigs; one had five which all lived, the other had eight and one died; one is to farrow soon; the other lost her pigs.

I live on a 160-acre farm. We farm mostly in wheat.

Don't you juniors ever think that I do not take an interest in dairying because I do. We have no pure-bred cattle aside from three Shorthorns but they are not milch cows. But never mind, I will show you some day. I am going to try to do what the pledge says.

I want some of you juniors to write to me. I like to hear of your calves although I do not have them myself. I will answer.

With good luck to all juniors. My address is Williams, Mont. Wesley O. Stearns.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I am eleven years old and am in the fifth grade at school. My father takes Hoard's Dairyman and I read the junior pages every time the paper comes. My father has nine head of registered Ayrshire cattle. And I have a registered Ayrshire heifer sixteen months old. Her name is Miss Grace of Pine Hurst. How she came to have the name Miss Grace is because I was sick in the hospital when she was born so my father named her my middle name. She is a big heifer for her age. She is almost all white and has a straight back. We brought her and seven other Ayrshires clear from Southern Minnesota. Papa has three A. R. cows. We think Ayrshires are the only cows. If any of the juniors want to write to me my address is Arcade, N. Y. Anita Grace Cowles.

When building with concrete don't experiment—use Lehigh—the National Cement. Get it from the nearest Lehigh dealer; he displays the blue and white sign. Discuss your plans with him; you'll find him ready to serve you. He's a good man to know.

Married man wants job on dairy. Two good milkers. 20 years a farmer. E. ALLEN, Wonewoc, Wis

County H.-F. Association in Connecticut

Breeders of Holsteins met at 11 o'clock May 5th at the Windham County Farmers' Association office Putnam, Connecticut, at the call of County Agent F. L. Davis, and formed the Windham County Holstein Association. E. C. Rogers was elected president; George H. Kimball, vice president; and William S. Warren secretary-treasurer. This is the first county Holstein association to be organized in the state of Connecticut.

Missouri Holstein Breaks Record

Beulah Johanna Korndyke, a junior 3-year-old Holstein heifer owned by John F. Bluhm, Missouri, has broken the record for her class in that state by producing in seven days 628.5 pounds of milk containing 20.24 pounds fat. On yearly test she produced in one month 2,633.1 pounds of milk containing 84.79 pounds fat. When credited with a handicap for her age, she was given first place among Missouri cows for the month in the "Cow Race".

Ideal Quarters for 1921 Show

THE illustration shown below is of the new cattle barn on the grounds of the Minnesota State Fair. This will house the machinery exhibits and the cattle entered in the 1921 National Dairy Show. The inside measurements are 398 feet by 233 feet with a mezzanine floor 34 feet wide, 12 feet above the main floor. The total available exhibit space is 61,360 square feet, a little more than used by the 1920 show in the stock yard buildings at Chicago.

Secretary W. E. Skinner writes of the 1921 quarters for the Show:

"This building will have cost over $400,000 when finished, and is one of the best show buildings that we know of in the United States. The glory of the whole thing is that there is no better space for one than for another. The whole exhibit will be on view to everyone entering the door. The obstacles are so few that one can get a glimpse of every exhibit in the place by standing just within the front door. An interesting feature is that we sold more space for this year's show on the opening of the space sale on April 14th than we ever sold on any previous first day—the entire ground floor being sold out, and a great deal of the mezzanine."

CATTLE BARN OF THE MINNESOTA STATE FAIR WHERE THE 1921 NATIONAL DAIRY SHOW WILL BE HELD

Sheboygan County, Wis., Sells Holsteins

Sheboygan County, Wis., held one of the most successful county sales of the season May 20 at Plymouth, Wis., selling 62 animals for an average of $225. Bidding was fast from the first, the entire lot being sold in less than 4 hours.

Isaac De Munck bought the highest priced cow, Yeslehtine Bess, a 28-lb. granddaughter of Sir Hengerveld De Kol Ormsby, for $675. She was consigned by S. A. Eastman.

Mack and Laux did the selling with Everson in the box.

Following is a list of those animals selling for $300 or more and buyers:

G. J. Kempink, Wisconsin	
Pinehurst Miss Ormsby Beauty	$305
J. E. Stauss, Wisconsin	
Kingwood De Kol Hengerveld Segis	$350
Admiral Neith Hengerveld	310
H. J. Goelzer, Wisconsin	
Segis Cornucopia Wa Wa	$305
Cora Eagle De Kol	335
J. E. Curtis, Wisconsin	
Bessie Beauty Belle 2d	$300
Laura Mechthilde Dale	300
Queen Carmeline Spofford	300
Bessie Piebe Mercedes	500
Johanna Peeress De Kol Fayne 4th	300
Floyd Kabmerton, Wisconsin	
Vickery Vale Hengerveld Concordia	$330
Isaac De Munck, Wisconsin	
Lady Palestine Pinehurst	$445
Yesletine Bess	$675
R. C. Stolper, Wisconsin	
Irene Bessie	$400
Otto Zemke, Wisconsin	
Daisy De Kol Pontiac Segis	$300
H. Ebenreiter, Wisconsin	
Cleveland Ormsby Irma	$400

Portage County, Wis. Sells Guernseys

Prices did not rule particularly high at the Portage County Guernsey Breeders' Sale held May 2, at Amherst, Wis., but the consigners generally considered the sale successful.

The 52 pure-breds offered brought just short of $10,000 with $705 the high figure. L. E. Gordon, Jr., paid this for a 638-lb. granddaughter of Caseterilius, that should do even better on retest. She was consigned by Geo. E. Larson.

Love and Benjamin did the selling with Sale Manager F. E. Fox in the box.

The following list includes those animals selling for $300 or more and buyers:

Earl Lea, Wisconsin	
Bernice of Pauline's Wood	$400
R. K. McDonald, Wisconsin	
Fern of Gordondale	$400
Jno. Blaski, Wisconsin	
Lady Jessie's Noretta	$405
T. J. Jensen, Wisconsin	
Noreen of Gordondale	$345
Paul N. Pope, Wisconsin	
Rosette of Gordondale	$310
L. E. Gordon, Jr., Wisconsin	
Tellus	$705
Goldie of Stony Creek Farm	300
Geo. W. Kiel and Jno. A. Pritzl, Wisconsin	
Gold Ollie's Secret	$305

Wisconsin Calf Club Started

County Agent E. S. Leverich of Eau Claire County, Wisconsin, writes that boys' and girls' calf club work for 1921 is already well started in his county. Twenty-five boys and girls now own calves, the breeds represented being Guernsey, Holstein, and Jersey. A "Calf Club Special" will be added to the cattle classes at the county fair and all of the twenty-five members are pledged to show their calves. The calves are purchased outright by the club members. The banks accepted notes for them. The present aim is to continue the work so that the calves are owned until they come in milk and until Advanced Registry records can be made on them.

Ayrshire Advanced Registry

One hundred and thirty-six Ayrshire records completed in the last quarter year average 10,715 lbs. milk, 429.6 lbs. fat.

In the junior three-year-old division, Leto's Rosette, owned by Glen Foerd Farms, Pennsylvania, appears with a new world record of 16,448 lbs. milk, 650.11 lbs. fat. Ring Heather of South Farm, owned by the same farm, becomes a class leader, silver medal winner, and the living junior two-year-old champion of the breed with a record of 15,093 lbs. milk, 700.64 lbs. fat.

In the Roll of Honor division of 300 days, 162 animals have qualified during this last quarter with an average of 10,065 lbs. milk, 403.28 lbs. fat. There are two new champions in this division. The junior four-year-old, Pechora's Pride, owned by Matthew Hannah, Vermont, with a record of 12,395 lbs. milk, 406.67 lbs. fat, and the junior two-year-old, Ring Heather of Highland, with a record of 12,941 lbs. milk, 595.58 lbs. fat.

Pure-bred Dairy Cattle

The census report for Arizona shows a total of 3,108 pure-bred dairy animals owned on 562 farms. Of these cattle, 2,152 were females and 956 males. By breeds the number were as follows: 109 Ayrshire, 48 Guernsey, 1,778 Holstein, 669 Jersey, and 504 other breeds.

The report for Florida shows a total of 2,930 pure-bred dairy animals owned on 1,003 farms. Of these cattle, 2,514 were females and 416 males. By breeds the number were as follows: 46 Ayrshire, 68 Guernsey, 337 Holstein, 2,380 Jersey, and 99 other breeds.

The report for California shows a total of 19,144 pure-bred dairy animals owned on 3,959 farms. Of these cattle, 14,064 were females and 5,080 males. By breeds the number were as follows: 595 Ayrshire, 36 Brown Swiss, 1,145 Guernsey, 12,189 Holstein, 3,832 Jersey, and 1,347 other breeds.

"He Advised Me to Find Some Better Material"

On April 8, 1921, Mr. Frederick L. Stover, R. D. No. 2, Grand Rapids, Mich., wrote for information about Circle A Cork Brick. His letter relates an occurrence all too familiar to dairymen and breeders.

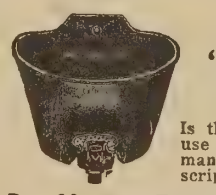
I noticed your advertisement of "Circle A Cork Brick" for cow stall floors. I have also talked with several users of your product, who are well satisfied with it. ••••••

I have a small herd of Jerseys that I keep as a side line, and find them very profitable indeed. About two months ago a valuable cow slipped in her stall, causing her to abort, and my loss was a very fine bull calf and a large bill from the veterinarian, who immediately told me the cause of the trouble. He advised me to find some better flooring for the stalls and pens if possible.

Will you please send me your booklet "Better Stall Floors" and a sample of "Circle A Cork Brick"?

TO avert similar accidents in your barn, to guard against the expense and trouble caused by broken bones, strained tendons, twisted joints, abortion and still-born calves, you need a floor which offers a safe foothold and eliminates the danger of slipping.

Take Circle A Cork Brick for example. Composed of finely ground cork and asphalt, they are resilient and easy underfoot. They make a floor which, wet or dry, is never slippery, but is always safe and certain to the tread.



Circle A Cork Brick are non-conductors of heat. Hence they are warm to the touch and protect the cows against rheumatism, garget, and other diseases which are caused by cold, insanitary floors. By promoting the well being of the herd and increasing the profits realized from more and better milk, Circle A Cork Brick will pay for themselves in a short time.

The 28-page book, "Better Stall Floors" tells you why Circle A Cork Brick are a profitable investment. We shall be pleased to send you a copy, together with a sample brick, which you may subject to any tests you desire.

TEXACO TRACTOIL

Ready when you are

AND ready for any test—ten hours, fifteen; twenty-four if need be.

It's a steady pull that counts—the ability to handle the work day after day through your heaviest rush season and when you need it most.

This is the thing that makes a tractor profitable.

There's one important requirement—proper lubrication with the right oil.

Texaco TRACTOIL is made for tractors.

It has the right body. The body which is different from a motor oil, because the work a tractor does at full speed and constant load demands a different type of lubricant.

Use Texaco TRACTOIL. Use it right.

Also use Texaco Thuban Compound in the gear cases — Texaco Crater Compound for exposed gears — and grease with Texaco Grease and you have the lubrication combination that makes for real tractor performance.

Ask your dealer for Texaco TRACTOIL— and the grade you need, "B", "C" or "D". It is supplied in 33- or 55-gallon steel drums, in wooden barrels or half barrels, or in 5-gallon sealed cans.

There's a Texaco lubricant for every purpose on the farm.

TEXACO Motor Oil

The uniform oil that keeps your motor active. It is a fine, lasting oil that completely retains its lubricating properties despite engine heat. It so perfectly seals the clearance between piston and cylinder, that no gasoline can leak into the crank case. Thus full compression is secured, and every last ounce of power used that the gas has to give. Be certain to get the can with the red Star and green T.

Sunflower Silage Experience in Northern Michigan

(Continued from page 850)

breeding ewes relished both types of silage about equally well, and we could see practically no difference in the results.

After checking up on the work with sunflowers at the different experiment stations, we have reason to believe that the sunflower is destined to be a large factor in the development of the live stock industry in counties too far north to produce well matured corn for silage. In the more southern counties of the state, also southern Wisconsin, the plant seems to rust badly, which causes the leaves to drop off. During the past two years we have had but little trouble that way at the Upper Peninsula Experiment Station. It is possible that climatic conditions may be such that the rust will have a very damaging effect during some seasons. However, Professor Spragg is now working to develop a rust resisting sunflower that will give us the high producing qualities of the variety now used.

We have gone far enough in experimental work in the Upper Peninsula with sunflowers to be confident that the crop will give a high production of a very palatable silage that has a better feeding value than the corn that is now produced. Another factor that favors the production of the sunflowers in preference to corn, is the fact that it is much more frost resistant during its latter stage of development.

Filled Milk a Common Enemy

HOARD'S DAIRYMAN:—There seems to be at last one common ground where the milk producer and the milk distributor should unite forces against a common enemy, and that is in the field of filled milk opposition. The filled milk business is destructive to the interests of both. Both need to leave no stone unturned to wipe out this industry which can have no excuse for existence. In a country whose storehouses are crammed with unused real milk products, why should the people have an inferior substitute offered them?

They are not saving money when buying this slightly cheaper product as they have nothing when it is bought that can in any way replace milk, as it lacks the vital elements of the latter. Scientists tell us that 90% of the vitamines of the skimmilk basis used has been removed, and is replaced by cocoanut oil which has no vitamines.

About 80 per cent of the total cottonseed oil production in 1920 went into lard substitutes, besides oil from peanuts, soy beans, corn, palm, and palm kernel oils. This is a big competition with hog raising but one which does not menace public health so strongly as does the cocoanut oil used in milk and butter substitutes.

In 1916 practically no vegetable oil was used in this country in milk or colored butter substitutes, it being confined to the manufacture of skin foods, machine lubricators, soap making, and kindred industries. In 1917 this country used a very small amount, 725 lbs. in margarine form, as an experiment largely to determine how the public liked this diverting of soap making materials into human food. Every one ignored the danger signals and in 1918 there were 112,494 lbs. of purely vegetable margarines in the market.

Still no one woke up and in 1919 the people bought and used 9,792,694 lbs. of the stuff, all this in colored form. Meantime the uncolored product had flourished much more strongly from the very start, there being used 1,941,932 lbs. of it in 1916., 21,803,482 lbs. in 1917, 88,861,472 lbs. in 1918, 132,906,154 lbs. in 1919, and 186,569,182 lbs. in 1920.

Filled milk production started much more recently and already has assumed enormous proportions. Judging by the growth nut margarines have made, if dairymen and milk distributors and manufacturers of condensed and powdered milks do not unite with the general public in eliminating this harmful food substitute from the market at once, where in three or four years' time will the milk and milk products industries be?

New York. E. F.

New Guernsey Champion

Laudholm Delight, a Guernsey owned by Laudholm Farms, Maine, is the new Class GG champion in New England with a record of 12,541 lbs. milk, 607.58 lbs. fat. She also ranks fifth in Class GG for the breed, and is one of the two youngest cows to qualify for class leadership in this division. She is a daughter of Florham Monarch, an A. R. son of Ne Plus Ultra.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Summer and Winter Dysentery

When dairy cows become severely affected with dysentery the economic loss is great as there is a serious shrinkage in milk secretion. Loss of flesh also occurs in all cattle and the disease sometimes is so virulent that it causes death. Ordinary diarrhoea is characterized by abnormal looseness of the bowels and rarely has very serious effects, but dysentery is always a matter of grave concern and should at once be given the best attention of the veterinarian and owner. The term is usually applied to that form of diarrhoea in which blood appears in the evacuations and that indicates inflammation and often ulceration of the lining membrane of the intestinal tract.

Grazing cattle sometimes are suddenly attacked by violent dysentery which may quickly affect every animal in the herd and its most severe form proves fatal. The animal soon recovers from a mild attack if given proper treatment, but suffers a serious shrinkage in milk flow which may continue until a subsequent calving.

The disease is caused by a protozoan microorganism (coccidium) which invades the mucous membranes of the intestines. Contaminated drinking water is, we think, a probable source of infection. The attacked animal strains, passes liquid, foul-smelling, gassy feces stained with blood or containing clots of blood. The presence of blood has given rise to the terms "red dysentery" or "bloody flux" and "bloody murrain", sometimes applied to the disease. The latter term also was at one time applied to anthrax or charbon. As soon as blood is seen the animal becomes deadly sick, stops eating and ruminating, weakens, staggers, goes down, becomes unconscious and dies in convulsion. In mild cases the symptoms do not become aggravated and tend to subside in a day or two.

Treatment proves futile in malignant attacks but usually succeeds in those of milder form. The entire herd should at once be moved to a different pasture where pure water is available. Affected animals should be stabled and put under the care of a trained veterinarian who may employ opium and morphin, not obtainable by the owner under the Harrison drug act. Other remedies likely to prove beneficial are acetic acid, catechu, creosote, capsicum, eucalyptus, salol, and subnitrate of bismuth. The veterinarian gives the drugs or combinations of them which in his experience have proved most effective.

The germ-caused form of dysentery which attacks cattle in winter and early spring quickly affects every member of the herd, young and old. Food and water, always to be suspected as sources of casual germs, cannot be assigned as the true ones in many outbreaks of this disease, for it occurs simultaneously on many farms. It does not quickly subside, often runs a protracted course, and always seriously affects milk secretion. The bowel discharges are mushy, chocolate-colored, and not foul-smelling as in the summer disease.

The veterinarian at once isolates attacked animals and administers one or other of the drugs already mentioned, beechwood creosote being particularly effective. Stimulants in strong coffee are also beneficial.

Supernumerary Teat

I have a yearling Jersey heifer with a supernumerary teat about one-half the size of others. Is it necessary that it be removed and if so should I employ a veterinarian?

Wilder, Ida. W. I. T.

The supernumerary or extra teat may be removed by amputation, for which operation it would be best to employ a qualified veterinarian, or by ligation which can be done by anyone. Both operations should be done when the heifer or cow is not giving milk. In some instances, the normal teat and the extra one are so close together that they may be milked as one and when that can be done, an operation is not advisable. In such cases the two teats sometimes are joined by a web of tissue, both being normal, and in that condition the web should be separated by cutting with scissors or a scalpel.

When a supernumerary teat yields milk simply amputating it may not suffice, it often being necessary to obliterate the secreting gland of the additional teat. That is done by cutting and cauterization. The ligation method of removing a supernumerary teat consists in tying a fine cord very tightly around the base of the teat to stop circulation. That causes sloughing, after a time, and until this occurs it is well to apply pine tar once or twice a week. Such teats, however, are best removed when the animal is quite young.

Productive soils must have humus. It is cheaper and better to make it at home. Grow legumes.

Does Hot Water Kill BACTERIA?

Tests by the U. S. Bureau of Chemistry on milk and cream cans freshly washed and *steamed*, showed *200 million* bacteria to the cubic centimeter in the first rinse water and *13 million* after the fourth rinsing.

Hot Water at 110° Gets Only 1/3 the Bacteria

STERILAC

Disinfects — Deodorizes — Sterilizes

Wherever disease germs lurk, in home, dairy, feed and water troughs, etc., *Sterilac* brings sanitation. Used with alkali, *Sterilac* cuts the cost of cleaning and kills bacteria. Used in the rinse water (which itself contains germs) *Sterilac* cuts down the bacterial count to practically nothing.

Sterilac is many times as effective as carbolic acid, is practically tasteless and odorless, does not attack rubber, metals, fabrics, varnish. So safe you can use it to purify drinking water. Withstands hot weather and may be used in hot water.

Sample to Make 10 Gallons—FREE

Bottle to make 75 gallons, $1.00; to make 300 gallons, $3.00. Comes as a powder—no loss from breakage or freezing in shipment. Dissolve in water as you need it.

Ask your dealer for Sterilac or order direct, TODAY.

AN INVESTMENT THAT PAYS BIG DIVIDENDS

YOU couldn't grow strong in foul air—you wouldn't long be healthy—you'd have no appetite, no ambition if you had to breathe the poisoned odors of manure and excretions.

It's the same way with a cow. The deadly gasses from dung in the cowbarn ruin her digestion—poison her hay and other foods—sap her vitality and prevent her from giving you a maximum supply of good milk.

Ventilate Your Cowbarn with an ILG

FARM BARN POWER VENTILATOR

The ILG FARM BARN POWER VENTILATOR thoroughly drains the cowbarn of all poisoned fumes which arise. No expensive or complicated installation of flues or ducts are required. It's simple to install and economical to operate. Made for 32-Volt D. C. and 110-Volt Standard Currents.

Write direct for literature or ask your electrical or hardware merchant for a demonstration.

"Keep the Flies away"

I guarantee it

COW-EASE is a clean, liquid preparation of the right consistency for applying with a sprayer. For 20 years I have guaranteed it to keep flies off cattle and horses and in all that time it has given absolute satisfaction to farmers the country over. It neither gums the hair nor blisters the skin. Beyond being humane and sanitary it is profitable as well, for a herd sprayed regularly with **COW-EASE** throughout the fly season will yield more and better milk.

Ask your dealer for **COW-EASE.** If he cannot supply you, send me your order per my liberal trial offer below.

Iowa Guernsey Breeders Meet

The regular summer meeting of the Iowa Guernsey Breeders' Association was held at the Iowanola Guernsey farm, Des Moines, May 25th. This herd and plant have been built up by Mountain Brothers, two young men who have demonstrated what can be done by applying good, practical business principles to the management of a dairy farm. Their herd, which is one of the choicest in the Middle West, numbers about seventy-five head and they are doing regular, consistent A. R. work as well as capturing some of the choicest trophies in state and national show rings.

The Mountain Bros. are producing first quality Guernsey milk for city trade. Their stables and plant are thoroughly modern in every respect, and their only problem is to keep up with the demand.

The meeting as usual was a picnic affair. A goodly number from all parts of the state were in attendance and a spirit of optimism prevailed.

In the forenoon a judging demonstration was given by Mr. Chas. L. Hill and Professor H. H. Kildee. After lunch, which was served by the Mesdames Mountain upon the lawn in front of the residence, the regular program took place. Professor Kildee spoke with his characteristic enthusiasm upon the subject of constructive breeding. He emphasized with definite illustrations the fact that the farmer who pins his faith to the pure-bred dairy cow is not bewailing hard times nor is he staggered by the problems that are making pessimists out of many of those who cannot see any good in dairying. He also brought out the value of the pure-bred sire in increasing the productivity of the average farm herd, and he advocated greater co-operation among farmers in the purchase and use of such sires.

Mr. Chas. L. Hill of Wisconsin followed Professor Kildee with the subject of "The Guernsey Cow as a Servant of Mankind". He showed how the Guernsey cow helps solve the dominant problem of the high cost of living. She can use the products of the farm to make the choicest of human food—Guernsey milk—in a most economical and profitable manner. Modern conveniences in the home and on the farm follow the Guernsey cow. Mr. Hill also mentioned the value of the color of the Guernsey product as an asset and he showed what may be done in the way of promoting a greater demand for both the cattle and the product by good, reasonable, consistent publicity.

Professor McCandlish of Ames, who has been studying dairy conditions on the British Isles, compared the industry as he found it there with the same industry in the States. The English dairyman has not the same problems to meet that face the man on this side nor does the dairy industry over there compare favorably from a business standpoint with dairying over here.

Mr. J. E. Stallard, Guernsey association fieldman for the Middle West, spoke about the plans of the National Association in developing the demand for breeding stock. This is further recognition of the significance of publicity as the basic principle of all modern business success and it is only as dairying becomes a real business that it can succeed.

The last speaker was Mr. T. A. Hoverstad, development agent for the Chicago Great Western Railroad. He has had a long experience in this line. He spoke of the plans of the road to improve conditions all along its system by putting on demonstration trains that will show what the practical farmer can do in the way of soil culture and better home building through the agency of the pure-bred dairy cow.

The sale which followed on the 26th was held at the state fair grounds. Cattle were consigned by 14 Iowa breeders and all the purchasers were Iowa men. The consignments were outstanding in beauty of type and conformation and the breeding right through the whole catalog was very choice. It was also backed by A. R. records, yet the financial conditions which prevail just now prevented any sensational prices. The top of the sale, $400, was paid by W. T. Richmond for Itchen Lillie of Prospect 68496, a five-year-old cow consigned by the Marsh Farms. She is a beautiful individual, remarkably well bred, and is easily worth several times the price paid for her.

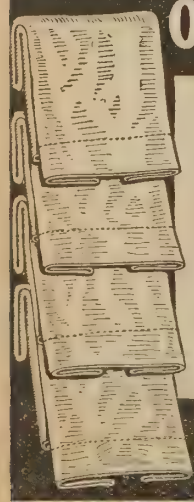
The demand for bulls was not as strong as it should be. The farmers of Iowa could not invest their money to better advantage than to buy these sires at the prices they brought and use them upon the common herds that dot the pastures of the state.

Albert L. Hyzer, secretary of the Iowa Association, was manager of the sale. Chas. L. Hill was in the box and Oliver Johnson was auctioneer.

SUBSCRIBER.

The Hoof and Horn Club of the Illinois College of Agriculture recently held a judging contest on various classes of live stock and it was considered a big success. In addition to 237 upper classmen and 127 freshmen who entered the contest, 98 non-collegiate men and women entered consisting of farmers, breeders, farm boys and girls, high school boys, Smith-Hughes instructors, and several county and assistant county advisors. This judging contest was inaugurated for the purpose of training people in the art of judging live stock and to obtain an understanding of what constitutes proper type of all classes of live stock.

Blue Earth County, Minnesota, has the largest calf club in that state, and the calves have been distributed among the boys and girls who are members of the calf club. They will be brought together this fall and judged at the county fair.



Silos Are Essential to Dairy Progress

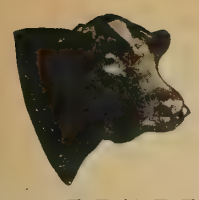
Public Auction of 55 Reg. Guernsey Cattle

TO BE SOLD AT

Dover Fair Grounds, Dover, O., Wed., June 22

In this sale will be sold one of the highest producing Guernsey herds in the state. The whole herd has an average of 8,427.1 lbs. milk, 366.7 lbs. butterfat. The test herd's average will be close to 9,533.0 lbs. milk, 425 lbs. fat, including heifers with first calf records up to 11,600.0 lbs. milk, 570.0 lbs. fat, each promising for state record in her respective class. Their sons and daughters will be sold with them. They also carried high honors in the Tuscarawas County cow-testing association for year ending March 1921. These cows and heifers are all bred or will be bred to a worthy grandson of Itchen Daisy May King of Langwater 17349. His first sons and daughters will be evidence in the sale as to his ability to transmit Guernsey type.



This sale will consist of close-up springers, fall cows, fresh cows, bred and open heifers, of popular breeding.

A few Big Type and Spotted Poland China Hogs will be sold at sale. Sale begins at 12:30 p. m.

THE AMERICAN GUERNSEY CATTLE CLUB, BOX H46, PETERBORO, N. H.

Feed Grain on Pasture

Professor G. C. Humphrey of the Wisconsin College of Agriculture suggests that cows producing less than one pound of butterfat per day and that are in good condition will undoubtedly prove most profitable with pasture alone. The following mixtures are suggested for summer feeding:

1. On good pasture: 100 lbs. ground oats, 100 lbs. wheat bran, and 50 lbs. corn meal.

2. On fair pasture: 200 lbs. wheat bran, 200 lbs. corn meal, and 50 lbs. oil meal.

3. On dry summer pasture: 500 lbs. corn and cob meal and 200 lbs. oil meal.

Cottonseed meal or gluten meal are substitutes for oil meal. Hominy feed or ground barley are substitutes for corn meal. If these feeds are not available good commercial mixed feeds may be bought to good advantage for the best cows of the herd.

International Grain and Hay Show

Announcement is made by the International Live Stock Exposition management that the third International Grain and Hay Show will be held at the Union Stock Yards at Chicago November 26 to December 3, in connection with the 1921 International Live Stock Exposition.

The Chicago Board of Trade has announced that it will again contribute $10,000 in premiums, as it has done for each of the two previous shows.

The United States and Canada have been divided into six districts from which entries may be made for this show in the classes scheduled for corn, oats, barley, wheat, soy beans, cowpeas, field peas, rye, kafir, milo, and small seeds.

Classes are arranged for boys' and girls' clubs and suitable prizes will be awarded. Educational exhibit from the agricultural colleges and experiment stations will be a big feature. The premium list can be secured by writing the International Grain and Hay Show.

Carries 50 per cent blood of Imp. King of the May, greatest bull of the breed.

His dam is Langwater Lustre, A. R. 806.10 lbs. fat, fifth cow in Class C. She is the second highest testing daughter of King of the May. His sire is Langwater Holliston, sire of Langwater Levity, sold for $6,000.00 and leading cow in Class EE. Traveler's daughters are averaging over 500 lbs. of fat with their first calves. His first daughter to freshen will be a class leader in FF. We offer some excellent bull calves by Traveler out of May Rose cows with fine records. Federal Accredited Herd.

CHICONA FARM GUERNSEYS
A. L. Gile, Prop., Chinook, Washington.

Has in its Herd 15 A. R. Guernseys and 11 R. of M. Jerseys
And Carries About 16 Cows on Test.

To inquiries for BULL CALVES we give full, honest particulars and stand behind every animal sold.
Jersey Sire—A Son of Pogis 99th. Guernsey Sire, Langwater Islander.

Dairy Cows in Wisconsin

The new census for 1919 distinguishes for the first time between dairy cattle and beef cattle. The figures just announced for Wisconsin give that state credit for 2,763,483 dairy cattle and only 287,346 beef cattle. The dairy cattle consist of 503,256 calves under one year, 384,695 heifers over one year and under two, 1,795,122 cows two years old and over, and 80,410 bulls one year old and over. Comparison with other dairy states are not yet available.

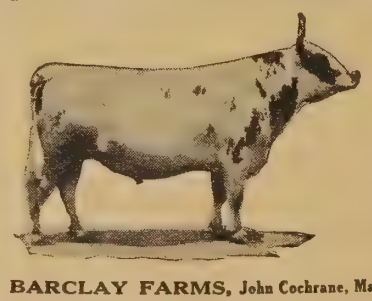
MIDDLESEX MEADOWS FARM

OFFERS

Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Nethercall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrgin Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat; 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.



Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we **KNOW** you can't get as good as these two for any less money elsewhere.

A. Henry Higginson (Owner). W. R. COUTTS, (Supt.)
South Lincoln, Massachusetts

Milk Organizations Forming Rapidly

We gather from the following reports of the Illinois Agricultural Association that milk producers' associations are being rapidly organized in that state.

"The Stephenson County, Ill., Farm Bureau, in co-operation with a milk marketing organization of from 400 to 500 members shipping to Freeport, has begun the building of a dairy marketing plant to cost $30,000. The new building will contain offices for the county farm advisor and his staff and an assembly room where farm bureau and milk marketing association members may hold conferences.

"At a large meeting of milk producers about Quincy held under the auspices of the county farm bureau, a committee was appointed to make a survey of the territory and, if deemed advisable, to recommend a permanent organization.

"Milk producers of the Galesburg district have met with the Knox County Farm Bureau and are surveying the district with the same end in view. The marketing situation has been fairly satisfactory there, so it was reported, and the organization, if formed, will attempt to use the existing machinery of marketing as far as is possible.

"The dairy marketing committee of the Jo Daviess County Farm Bureau is considering the advisability of an organization of farmers investing capital in an idle condensing plant at Galena."

1,000 Minnesota Cows on Test

As the number of cows in Minnesota on yearly test continues to increase, Mr. M. H. Fohrman, who has charge of official testing in that state, predicts that within the year fully 1,000 cows will be on official test.

In April 829 were tested. Of this number 163 produced 4 lbs. of butterfat or more in two days. Of the cows on test 7.9 per cent are Holsteins, 19.2 per cent Guernseys, and 7.7 per cent Jerseys.

In April 7 records of over 30 lbs. of butter were made in seven days and, of the total 157 7-day records completed, 41½ per cent were over 20 lbs. of butter.

Neeltje Mercedes De Kol Homeland, a Holstein cow owned by Spaulding Farm, has made 3,636 lbs. milk, 107.44 lbs. fat in 30 days; 7,008 lbs. milk, 213.68 lbs. fat in 60 days; and 11,033 lbs. milk, 353 lbs. fat in 100 days.

You can't afford to build a silo without a good foundation. Uneven settling has cracked or warped many a silo, and even overturned them.

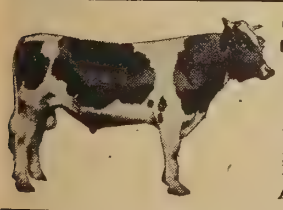
JOHN B. IRWIN, Sta. F, Minneapolis, Minn.

Registered Cows and Heifers

We have on hand more females than we usually carry so are able to offer some good ones for sale. A number have A. R. O. records and most of them are from tested dams. Bred to a yearly record sire and themselves backed by yearly producers.

Address correspondence to Axel Hansen, formerly with John B. Irwin.

MINERAL SPRINGS STOCK FARM, - - SAVAGE, MINNESOTA
Stuart—McIntyre—Hansen, Owners.



Address correspondence to Axel Hansen, formerly with John B. Irwin.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

Sir Walker Segis Homestead

The best show bull and son of the great bull, PIEBE LAURA OLLIE HOMESTEAD, out of a "COUNT" daughter, BEAUTY BEETS WALKER SEGIS, world's greatest heifer, with two yearly records over 25,000 lbs. milk and 1,000 lbs. butter in heifer form, and a seven-day record of 35.03 lbs. butter from 730 lbs. milk.

We offer several choice bulls, one month to a year old, out of high yearly record and A. R. O. cows, at very reasonable present day prices. Pedigrees and photos will be sent.

A. J. LASHBROOK, - - Northfield, Minnesota

Serviceable Sons of Dutchland Aaggie Tidy Prince

I have three of these youngsters for sale, all ready for service and from A. R. O. granddaughters of S. P. O. M. Their sire is from a sister to Tidy Abbekerk Prince and already has a good list of tested daughters, including one above 36 lbs.

Write today for complete information.

E. J. BROSIOUS, - - Stillwater, Minn.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams. For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

Grandsons of

Duchess Skylark Ormsby and of S. P. O. M. 38th

Good Ones — From Yearly Record Dams. Priced to Sell.

POPLAR HOLLOW STOCK FARM,
Bertram D. Scott, Prop., Richfield Station
Minneapolis, Minn.

THE MARK OF QUALITY

Success Insurance

"A Son of Count"

Suppose someone offered to insure your future success as a breeder and charge you only a small premium. Would you pass up such an opportunity? Not many of you would.

Oak Dale is offering some breeder the chance of a lifetime to buy herd insurance. The offer comes in the shape of a young Bull, a son of King Segis Pontiac Count, the greatest sire of all times.

"Count" has more daughters with over 700 lbs. milk than any other living sire. He is the only sire that ever lived with three daughters with over 700 lbs. milk under full age. He has more daughters with records above 1,000 lbs. butter than any other living sire. His daughters have won more first prizes in the past five years than the daughters of any other sire in a lifetime.

Buffalo Lois Beets, the dam, seven days 22 lbs. butter, is by a son of Paul Beets De Kol. One of this great bull's grandsons is the sire of the present world champion four-year-old. Buffalo Lois Beets bears the same relation to Paul Beets De Kol as does the sire of this world champion 46-lb. four-year-old.

This young bull traces twice to Pontiac Korndyke, Hengerveld De Kol, King Segis and King of the Pontiacs; once to Paul Beets De Kol and Sarcastic Lad. Thus, in the first five generations he has represented six of the greatest bulls the breed has ever known.

Is this herd insurance or not? Figure it out for yourself. The price of this bull is so reasonable that anyone can afford to pay it.

Write for complete information or come and see him, if you can. The farm is on the Oak Dale Trail at Blooming Prairie, Minnesota.

Holstein Bulls

At Farmers' Prices

We are not in the game to get rich but to help promote the breed by offering pure-bred bulls at the lowest prices, enough to cover raising. Write for prices and descriptive list. The Ormsby kind.

RAMSEY COUNTY HOME,
J. E. McMahon, Supt., North St. Paul, Minn.

"A helper and myself milked, stripped and carried away milk from 97 cows in less than three hours with our Perfection Milkers." —A. W. WARD.

You Can Reduce Your Milking Time

HOW long would it take you and your helper to milk 97 cows by hand? How many could you milk in three hours? One Perfection owner writes that he and his helper milked, stripped and carried away milk from 97 cows in less than three hours.

Whether you have 9 cows or 97 cows you can milk them better and more quickly with a Perfection than by hand milking. You can get along with less help by replacing two of your hand milkers with a Perfection. Here's a chance to save that time you need for other work.

Perfection does more than shorten milking hours. It saves milking drudgery and usually gives you an increase in milk flow. It saves in wages enough to pay for itself in less than a year.

It's easy to see that if you can shorten the hours of your present milking you can increase the size of your herd. Or with the same herd you can get along with less help. You profit either way. Thousands of owners have increased their dairy profits by increasing their herds after installing Perfection Milkers.

Send For Complete Information

You can get complete information on shortening your milking time. Write and let us send a free copy of, "What the Dairyman Wants to Know." We'll also send the names and addresses of Perfection owners near you.

Why Milk By Hand? Perfection milks in one third the time.

Riverside Cords

$17.25 30 x 3½

This price good only until July 31st

Guaranteed **10,000** Miles

Shipping Weight, 17 Pounds

Sent by parcel post within 150 miles of any of our five houses for 21c postage; within 300 miles for 38c postage; within 600 miles for 71c postage.

RIVERSIDE TIRES are NOT Seconds. They are clean, factory firsts of the highest quality—guaranteed by us to be made as good as tires can be made.

Each tire has our trade-marked name—"Riverside." And the name "Riverside" stamped on a tire is as good as the name "Montgomery Ward & Co." written on a check.

An Absolute Guarantee
By Montgomery Ward & Co.

We do not believe there is any firm from whom you buy tires that has an equally old, time-tried Guarantee of "Satisfaction or Your Money Back."

For over forty-nine years, Ward's has sold everything on a Guarantee basis. Millions of customers in that forty-nine years have bought hundreds of millions of dollars' worth of merchandise under that Guarantee.

So, no thinking person can have any doubt, any hesitancy ordering a Ward's Riverside Tire—with the full knowledge that our forty-nine-year-old reputation will be lived up to absolutely.

We guarantee Ward's Riverside Fabric Tires for 6,000 miles. We mean exactly that.

We guarantee Ward's Riverside Cord Tires for 10,000 miles. We mean exactly that.

There can be no risk whatsoever in your ordering a tire from Montgomery Ward & Co. We know that the prices we quote are very low. But the saving we offer is a real saving on the finest grade of clean factory firsts.

Save One-Third on YOUR Tires, TOO!

Read what we say here about prices: "The Plain Truth about these Low Prices"—and then send your order now.

With an absolute guarantee, backed by a house of unquestioned reliability—Why not at least try Ward's Riverside Tires? Why not save one-third on YOUR tires, too!

The Plain Truth
about these Low Prices

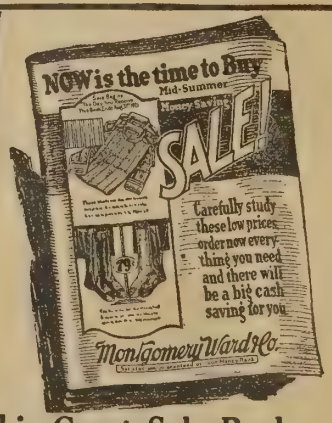
First let us say that we believe you will ***never again buy tires at such low prices***—unless there is some great discovery of a new way of making tires.

Just consider that before the war, rubber was 60 cents per pound and formerly it was $1.10 per pound. During the war, rubber actually went down to 50 cents per pound.

Last spring the tire business was demoralized. Rubber went to 18 cents per pound. Cotton broke from 40 cents per pound to 12 cents. It is said that 40,000 people moved away from Akron—the great tire making city.

And there, with everything at the low mark, was the opportunity we are always looking for, with cash in hand, to secure a saving for our customers.

With some great change in making tires—some discovery—you may some time in the years to come buy tires cheaper. But otherwise, Ward's prices in this Summer Sale will be the lowest prices at which you ever bought standard, high grade, guaranteed factory firsts.



Do You Own a Buick, Packard, Cadillac, or Hudson?

We quote here our great Mid-Summer Sale Price on a 30 x 3½ tire for Overlands, Fords, Maxwells, Dorts, Chevrolets, etc.

But you who own Buicks, Packards and other cars, write for the book below, our July-August Sale Book. It offers you a saving of one-third on all sizes of Fabric Tires—and on Ward's Riverside Cord Tires—guaranteed for 10,000 Miles.

MONTGOMERY WARD & CO.

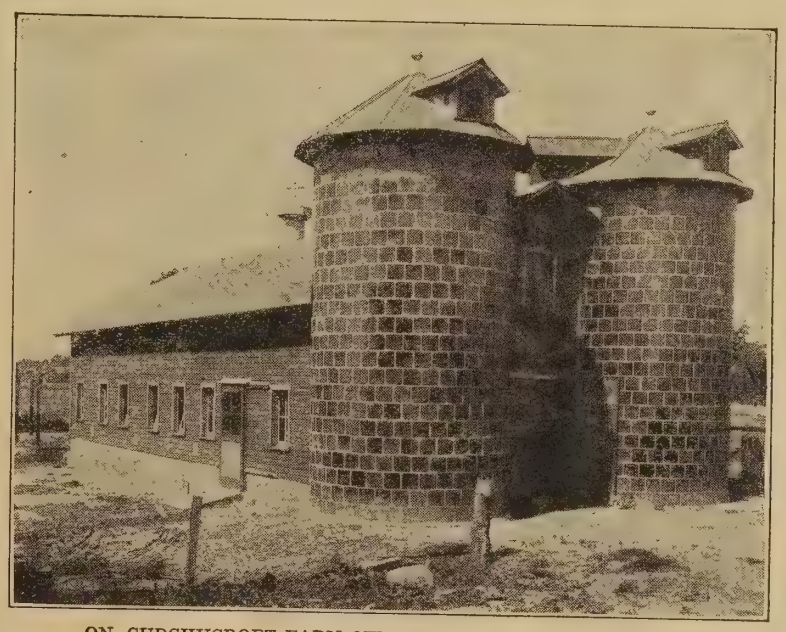
HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXI — FORT ATKINSON, WIS., JUNE 17, 1921 — Number 22

IT does beat all how car-crazy some folks are! Lem Jackson is a case in point, but for that matter his name is legion when it comes to going motor-mad. Lem is a young unmarried fellow that never amounted to a hill o' beans. His folks live up the valley on a rutty, infertile little farm with buildings that totter against each other for mutual support. Lem's mother never had a decent thing in her life to keep house with, and they are going to throw out Lem's father's milk from the shipping station because his cows are housed in such a damp, dark, unsanitary, old fashioned barn, and he evidently hasn't money or ambition to fix up sufficiently to pass the Board of Health's inspection. But Lem has got a car, you bet! How he got enough capital together in the first place to pay the first installment nobody pretends to guess, but then, that has always been a deep mystery in millions of cases! Lem and his seedy old dad and mother go off every now and then in the fliver and have a fine time. It is supposed they go motoring whenever Lem has the price of a gallon of gas in his jeans, which of course can't naturally happen every day. Lem is a loud-mouthed bag of wind and, to hear him talk, you'd think he was mayor of the town and the whole county was his oyster. But they say that the Jacksons barely have enough to eat sometimes and that the inside of their poor home is shocking in its needs. But Lem and his folks certainly enjoy their car and they ride around in great state when some others I might mention still walk. Lem says you might as well be dead these days if you don't own an auto.

⚜



They made a farm bureau canvass in our town last fall for members, the plan being to sign up everybody for five years for $5. A lot of the old members seemed to think this was coming down on 'em altogether too heavy and although you'd think that farmers everywhere would be wise to the benefits conferred by this organization, yet the thought of shelling out $5 instead of the former $2 was too much in the opinions of a few of the less public-spirited ones. One farmer who is very well-to-do said he would pay the $2 as usual if the canvasser wanted his name bad enough to put up the other $3. This was done. The next day the $2 man bought his daughter a pretty $5 silk waist because he succeeded in joining the farm bureau so cheaply.

⚜

A certain little village near a small city is noted for the quiet, industrious farming community which it centers. When folks here want something doing, they go to the nearby city to the movies or band concerts or auto shows. When they're home they mind their own business and attend with single purpose to the work in hand. Whenever the editor of the city daily newspaper wants to be smart, he refers to Riverville as Sleepytown or Deadville. He printed a story the other day on Riverville which made some of the latter's proud citizens sort of hot under the collar. The story ran like this: A man went to consult his doctor because he was on the verge of a nervous break-down. The doctor told him to go to some place where he would have absolute quiet—where there was absolutely nothing doing. "But you know there is no such place literally, doctor," protested the sick patient. "Oh, yes there is!" said the doctor with conviction, "You'll find it at Riverville." Several Riverville folks stopped their subscriptions to the Daily Clarion after this mean hit, but the most of the townsmen just laughed. That editor better look out, nevertheless, how he tramples on the civic pride of Riverville.

FARM STUFF

HELEN S. K. WILLCOX, NEW YORK

ON CUDCHUCROFT FARM OWNED BY A. A. FULK, INDIANA

This modern barn, with its two tile silos 12x34 ft., was built seven years ago. It has modern equipment and makes a splendid cow home. Of his silos, Mr. Fulk writes: "They are as good today as when built and have proven entirely satisfactory."

⚜

Mart Brown was a prosperous farmer many years ago and he had a son who showed no particular promise of following in the footsteps of his old horny-handed dad. This son's name was Joe and he simply wouldn't take hold of the work or show any ambition for any other calling either. One day his father told him he'd got to earn some clothes money for himself. So the old man provided him with a few bushels of nice, early apples and told Joe to try his luck selling them in the town nearby. That night Joe returned to the farm behind Molly, the old mare, but the high platform wagon seemed to draw just as when Joe started off in the morning, also he could see the bulging sacks, which by all rights should have been empty and folded under the seat. "What! couldn't you sell none of them nice Yellow Transparents?" asked Mart in bewildered surprise. Joe hung his head under his father's scrutiny and finally blurted out, "But, pa, nobody asked me what I had to sell!"

⚜

Perk Calkins is a shiftless, good for nothing sort of fellow and his neighbors over at Hornersburg have small patience with him. He keeps scrub stock and grows scrub crops and is raising a scrub family. But Perk's pet passion is tools. He can't seem to get enough of them and, as all the agents believe in trying a poor-pay prospect just once, Perk always has an assortment of machinery gathered around his barns and yard sufficient to supply the county. He usually has half-a-dozen different kinds of mowing machine, rake, harvester, reaper, plow, harrow, cultivator, hay loader, engine and land knows what all sitting round his barn, rusting and drying up in the elements. In a year or two the agent which sells each sample comes and finally gets his particular property, having given Perk up as a hopeless proposition. But there is always another willing and anxious to let Perk buy his kind on trial or on "time". Perk collects his tools the way some folks collect Indian relics or old furniture. He is never so happy as when he's got fifty-seven varieties of machines on hand. Hornersburg people say they should think the agents would be wise to Perk by this time and would save themselves the trouble of "selling" Perk. But I figure that a machine agent is a born optimist anyhow, and when he meets another one like poor Perk Calkins, the sale is made before either of them realizes it. Hornersburg folks hadn't ought to kick as they get lots of chances to buy secondhand tools of the agents after Perk has had the pleasure of storing 'em out under the trees for a year.

⚜

Perk Calkins has a cousin who is like him in lots of ways. Carl doesn't collect machinery but every piece he's got has the sky for a roof, same as Perk's. Carl naturally can't afford to let his tools rust away in the corners of fences the year round, serving as convenient perches and roosts for the hens and birds, but that apparently is the least of his troubles. Last Halloween some boys full of mischief from Hornersburg came down to Carl's farm to see what deviltry they could get away with. There were any number of tools they might have moved onto the church steeple or hung from nearby roofs and platforms as boys have done that night since time immemorial, but for some reason they didn't see fit to do it. Instead, when Carl went out to do chores in the morning, he found his ancient five-passenger "touring" gone from the shed—the only machine he owned under cover—and of course he was awfully wrought up. He was going to notify the authorities of the theft and started down to the big elm for his road-wagon where he was in the habit of stopping it, when what should he see but the old auto keeping the dilapidated wagon company. The boys, with real logic, had run the car down to the elm as being more in consistency with Carl's habits than to store it under the shed. The wagon and old auto had been observed by all the milk teams as Carl wasn't an early riser. Perhaps the jollying he got did Carl good, for this year he's begun to build a big new tool shed and garage.

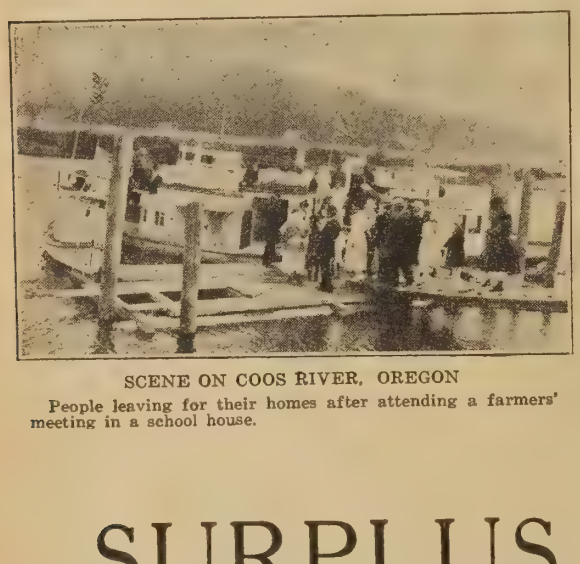
⚜

John Rogers says that a good farmer is known by his deeds rather than his words. He says you can always tell one. John is of the old school but there is much truth in his ideas. He says a good farmer always keeps one jump ahead of his work instead of allowing the work to be a little ahead of him. He says you've got to get up in the morning to get in your best licks and then stay up and awake for the remainder of a long day. He says anybody that is afraid of working like all-get-out will get out all right from the farm, and that it's all nonsense that a man can't stand it to work hard if he possesses ordinary health and strength. John has always maintained that contact with the good old dirt makes a man hard as nails and able to stand the gaff without any apologies. Brain and brawn, John says, conquer any farm he's ever heard of.

A DAIRYLAND VENICE

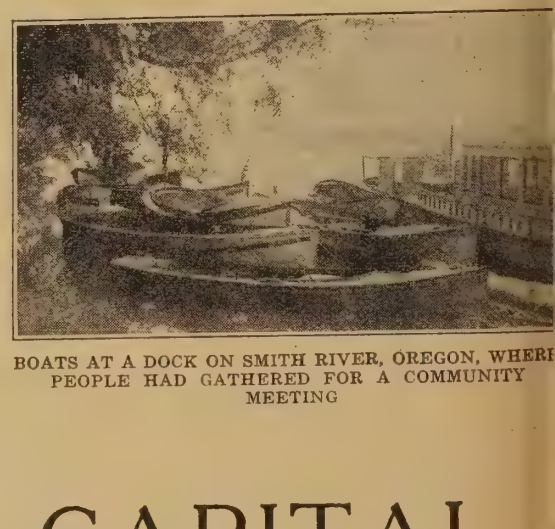
E. B. FITTS, Oregon Agricultural College

DAIRYING in certain sections of the coast counties of Oregon is unique in some respects in comparison with dairying in other parts of the United States.



At numerous places along the coast are ocean inlets and rivers emptying into the sea. These inlets and branches of the rivers extend often for many miles back into the country through valleys of varying width and between high ranges of hills. These waterways that drain the valleys are often deep, slow moving, and but very little above the level of the sea. Indeed in some instances the rise and fall of the tide extends back for a distance of twenty miles or more from the ocean. These valleys are generally very narrow although some spread out for a mile or more on either side of the stream. In many places dykes are necessary to keep the land from being flooded at high tide, the buildings being on higher land at the base of the hills. The soil is very deep and exceedingly fertile. A natural grass and clover mixture grows luxuriantly all over these low lands except where swampy tracts occur or the tide overflows and an abundant rainfall during nine months keeps the pastures green almost the year round. Dairying under these conditions in times past consisted of little more than driving the cows to barn or corral for milking and releasing them again to gather more of the ever abundant green feed for the manufacture of more buckets full of milk. In fact, on some farms there has been little or no cultivated land and very little hay cut and cured for winter feeding. Cows have been bred to freshen in the early spring, were milked as long as the pastures were good, then turned dry to rough it through the winter with little or no hay supplied. The average production per cow even under these conditions was probably above that of the average dairy cow of the country.

Many of the more enterprising men in these sections, however, have listened to the gospel of better dairying and are preparing to make the most of the very favorable natural conditions that are theirs. Better cattle are being brought in, scrubs weeded out through cow test association records, and registered bulls from high producing ancestors placed at the head of many herds. Some herd averages are now running close to 400 lbs. of fat per cow. With the better cattle are coming better buildings, better methods of feeding and handling, and a growing pride on the part of the dairymen in their herds. In some sections there are already whole herds of registered cattle and the improvement has been so great that at state and international fairs during the past two years a considerable number of the prize winning animals have come from the coast counties.



A MILK BOAT UNLOADING AT CREAMERY DOCK ON COOS BAY, OREGON

Many of these narrow valleys have no roads and the only way of travelling from farm to farm or to creamery or to the outside world is by water. Each farmer owns a power boat and a scow is used to move live stock or whatever freight needs to be transported. A daily milk boat collects milk or cream from landings in front of each farm and a rural delivery boat delivers the mail. Schools, churches, and grange or community halls stand at convenient points along the water ways and on school days a school boat takes the scholars to and from the school or the regular service boats adjust their schedule to school hours. Public entertainments often gather a score or more of boats at one point until the water way is nearly blocked. Late arrivals must "park" on the outside, fastening their boats to those nearer the dock, and find their way to shore over several intervening boats. The boats vary from an ordinary row boat with a little single cylinder engine to run its propeller to a six- or eight-cylinder speeder capable of twenty knots an hour. It is a novel and interesting event to attend a community gathering in one of these quiet valleys with wooded hills looming up on either side, to see the river filled with boats, to meet and talk with many people and to realize that there is not a foot of roadway within many miles. The lure of the automobile is penetrating the valleys and one hears much talk of opening up roads. In some cases surveys have been made and road construction is under way. Soon the chug of the motor boat will give way to the honk of the motor car and these Venice-like communities will progress to another stage in their development. It is, however, with extreme regret that some of the older residents watch the opening of roads into their picturesque valleys.

SCENE ON COOS RIVER, OREGON

People leaving for their homes after attending a farmers' meeting in a school house.

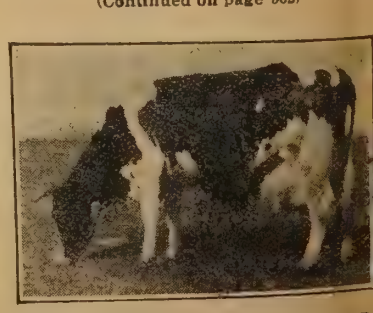
BOATS AT A DOCK ON SMITH RIVER, OREGON, WHERE PEOPLE HAD GATHERED FOR A COMMUNITY MEETING

SURPLUS PLANT AT CAPITAL

S. R. WINTERS, WASHINGTON, D. C.

THE operation of a central milk station in Washington, D. C., for utilizing the surplus products of the cow in the territory adjacent to the National Capital is a certainty. The milk plant manager has arrived and an order has been placed in Philadelphia for the factory machinery. Five hundred farmers and dairymen have subscribed approximately $70,000 toward the coveted figure of $100,000, originally specified as the requisite fund.

The co-operative milk utilization factory is a direct offspring of Maryland and Virginia Dairymen's Co-operative Association. A simplifying of the financial transactions of the factory project suggested the formation of a distinct corporate unit. The object of the corporation is to establish a manufacturing establishment where surplus milk from the producing territory can be profitably converted into butter, cheese, and other by-products when the market is glutted with vital fluid as such.



A building has been leased in an advantageous location where the perishable contribution of the milk pail is to be converted into attractive and salable products for consignment to various sections of the United States. It is anticipated that by divorcing the milk from the cream, a responsive market for the latter will be found in the South where cream is in constant demand. The cheese and butter manufactured from the surplus milk, however, will not likely command prices commensurate with fluid-milk figures. The powers of interference with the inexorable law of supply and demand are not claimed for the newly-established milk-consuming factory. No pretentions are made that the organization offers a panacea for all ills. Reasonable expectations are ventured, however, that in this unity of strength milk dealers in Washington will be forestalled in a frequently-recurring tendency to capitalize a few hundred gallons of excess milk as a lever in forcing downward the market price for the essential fluid. The central milk station offers an alternative from acceptance of the arbitrary figure of the distributor, a retention of the supply at home, or a forced peddling of the product from door to door in a city frequently unreceptive to such a practice.

The National Capital supports a milk-producing area embracing numerous counties in Maryland and Virginia, as well as scattering herds in the District of Columbia and West Virginia. Computations, conservatively arrived at, indicate that 1,300 farmers and dairymen contribute to the supply of milk consumed in Washington and that $20,000,000 is invested in farms, cows, barns, and equipment, making possible an undiminished yield. The residents of the District of Columbia consume approximately 35,000 gallons of milk daily.

The Maryland and Virginia Dairymen's Co-operative Association is strictly a mutual organization, its membership sharing the expenses and responsibilities of operating the central receiving milk station as well as participating equally in the rewards of the enterprise. Each dairyman was requested to invest in the project to the extent of $8 for each cow owned, although this figure was not arbitrarily applied in the pledging of subscriptions. At least one dairyman subscribed $1,500, several pledged $1,000 or more each, while still other payments were accepted in accordance with the ability of the farmer to pay rather than strict adherence to the tenatively-named basis of $8 for each animal in the herd. The $100,000 sight, it is calculated, is adequate for acquiring a lease on the building, installing machinery, and providing sufficient capital for operating expense. Obviously, the venture will not be self-supporting from the very beginning.

Operating capital is being raised through the sale of certificates of indebtedness to the milk producer. These certificates are promisso

HYDE PARK LADY DE KOL, OWNED BY ORIN R. BALES, KANSAS

This Holstein cow is now the state champion of Kansas in the seven-day division, having recently completed a record of 669 lbs. milk containing 26 lbs. fat. Prior to this mature record, she has two other seven-day records.

VERMONT CO-OPERATIVES FEDERATE

Creameries Join For Increased Returns Through Co-operative Management in Manufacturing and Selling

IT has remained for Vermont, the Denmark of America, to demonstrate the fundamentals in a complete system of economic co-operative marketing of dairy products. In the plan of the Vermont Co-operative Creameries Company is an example of co-operation that is no half-way affair. The Green Mountain dairy farmer-members of these creameries believe in the principle of co-operation and are ready to go the limit in supporting their belief. These creameries are the "solid foundation upon which is being built the great dairy industry of the state".

The plan of this organization of creameries is this: In a community where farmers believe in working together, a co-operative creamery is organized, 29 having been formed since 1915. Equipment is installed to permit marketing the product in any of several forms; fluid milk, cheese, butter, etc. Then a group of such creameries band together for the common good and buy equipment, employ uniform accounting systems, and sell their product co-operatively through one sales head—in the form which is in greatest demand and to the particular buyer who offers the best price. They own their plants; they can sell to anyone who will buy, and in the form of product in greatest demand. Through co-operation marked advantages are had in buying, in operating the several plants, and in selling.

The purpose of federating Vermont's creameries was clearly set forth by Commissioner of Agriculture E. S. Brigham before the Massachusetts State Board of Agriculture in 1917, when he said: "Co-operation should begin in the local community, among dairymen who have a similar problem, viz., to obtain the highest possible price for dairy products. The program should include not only the collective bargaining through a board of directors for the highest possible price, but also the production of fine quality products on the farms of its members and the hauling of these products to the railroad station or, wherever the number of cows is sufficient, to a central plant owned and operated by the organization where the milk may be processed so that it is marketable in any city and where in times of surplus it may be manufactured into butter or cheese."

THE RICHMOND CREAMERY, MOTHER OF THE FEDERATION. TWO HUNDRED THIRTY-FIVE MEMBERS ARE SENDING 65,000 LBS. OF MILK TO IT DAILY

A year previous to that the commissioner spoke in favor not only of this complete equipment for a single creamery but of a federation for increased co-operative benefits. Also in November, 1916, F. H. Edwards at a meeting at Richmond urged the necessity for a federation of co-operative creameries for the "purpose of encouragement, education, and better marketing".

Not until the winter of 1920 was such a federation formed. Then representatives of the co-operative creameries organized the Vermont Co-operative Creameries, Inc., incorporating for $200,000 for the purpose of obtaining for these creameries collectively certain advantages which they as individuals could not secure. The by-laws of the federation delegated to its directors the power of contracting with member creameries to supervise their accounting systems, to buy supplies co-operatively for the members, and to sell the products manufactured.

A Child of Adversity

This comprehensive scheme of economic marketing is the child of adversity. The idea had its beginning in the days of the leased car system which gave preferential rates to the large milk companies. Before the Interstate Commerce Commission's ruling in July, 1916, the rate on less than a carload shipment was prohibitive, leaving the producer no opportunity to ship his own milk; also, it cost more to ship a carload of milk to Boston from many points in Vermont than to ship from Canada.

Moreover, when a territory proved unprofitable as a source of milk the milk company abandoned it—leaving the producer to cast about for a market. Many of the present co-operatives are in such abandoned territories. At regular times the milk companies set a price for milk; the only thing necessary for the farmer to do was to "take it or leave it". Since he frequently had no other market, he had no choice.

SHELBURNE CREAMERY, MEMBER OF THE FEDERATION, WHERE A $800,000 BUSINESS WAS CONDUCTED IN 1920. ITS MEMBERSHIP GREW FROM 65 IN MAY, 1919, TO 205 in DECEMBER, 1920

Commissioner of Agriculture E. S. Brigham well summarized the condition which confronted these dairy farmers when he said: "It is not sound economics or sound business for a great industry like dairying to be absolutely dependent upon one set of middlemen to move dairy products from the farm to the market, with the ability to fix the price, as is now the case. The time has come for the dairymen of New England to formulate a declaration of independence, and to take such steps as will make that declaration mean something."

A "Declaration of Independence"

Out of this situation grew the Green Mountain farmer's determination to market his own product. His "declaration of independence" led to the organization of co-operative creameries. The diversity of the market, in the varying amount and type of product it would take, indicated the next step—that of equipping to ship any one of several products: whole milk, butter, cheese, etc.; creameries not on railroads equipped to manufacture butter, cheese, and casein. The final link completing the circle of co-operative effort—that of federating these individual creameries—was proposed by Commissioner Brigham and ably fostered among the creameries now federated by F. H. Edwards.

The purpose of the federation is to sell what the market will pay the most for—whether that be whole milk, butter, cheese, or condensed milk—and to sell wherever the best price is to be had. It is for wide open competition—with service and quality as selling points. It is a market free-lance, selling on the basis of supply and demand. It sells according to the demand for its products; if it can sell milk for more than butter or cheese will net, it sells milk without reference to the relation of the price received to that arbitrarily set by other organizations. As an example: the federation believes the present price of milk in Boston is out of relation to that of butter. It has therefore lately increased its fluid milk sales, sending a part of its output into a market formerly held by Connecticut and Massachusetts dairy farmers. The price secured nets its members more than could be gotten by selling butter or cheese. If market milk declines sufficiently, the federation's product will flow to more profitable channels.

A Market Stabilizer

No other plan of marketing has so great effect as a stabilizer. Under this scheme of selling, in times of surplus of any type of product, the output of the federation is turned to other forms. When the whole milk market is glutted and prices depressed, federation milk, instead of aggravating that undesirable situation, may go into butter, cheese, sweet cream, etc., thus tending to restore a balance. When there is a shortage of any particular form of product and the price is abnormally high, the federation output will supply that demand and stabilize the market. No more beneficial influence on the dairy market can be conceived than this. Neither the producer nor the consumer profits through uncertain supply and price. The best situation which can be created for the dairy farmer is that which insures him a uniform market free from uncertainties.

An Illustration of the System

The Richmond creamery, opened in November, 1916, offers a good example of the operations of one of the federation's member creameries. Within a year of its opening forty different buyers from several different cities had made offers for its entire output. Before the creamery was organized the producers sold to one company, frequently at an arbitrary price they had no part in making. Last month the daily intake of milk was about 65,000 lbs. sent in by 235 patrons, 200 of which are creamery members. One-half of the product went to Boston as whole milk, a 40-quart can bringing $3.30 for 3.7 per cent milk, minus $.38 freight. Some cheese was being made which sold for 25 to 26 cents. F. H. Edwards, manager, was giving considerable attention to making an ice cream mix, shipped ready for freezing. This was selling for $1.20 per gallon, less transportation, and the demand is constantly increasing. Considerable butter was being made and some sweet cream was being shipped, the latter selling for $23 for 40 quarts of 3. 8 per cent test. The ice cream mix is a product especially favorable to the plan of supplying the market which is most favorable. When butter does not sell high, it may be stored unsalted. Skimmilk, when it cannot be sold, is condensed and stored. Then, when the ice cream season is on, these two may be utilized in preparing the "mix". The casein market was so unfavorable in March that very little of that product was being made. Some skimmilk was being shipped to ice cream factories and bake shops. Buttermilk is shipped also.

The price paid to the members of the Richmond creamery for the first

(Continued on page 898)

National Holstein Meeting A Stormy Session

A FARCE of the worst kind. That phrase very well describes the 36th annual meeting of the Holstein-Friesian Association of America held at Syracuse, N. Y., June 1-2, if you judge it from the standpoint of what such a meeting should be—a meeting to truly represent the will and desire of the 20,000 or more association members.

When three or four men control such a meeting, even though five hundred or more members are present; when on most of the propositions they put through they are opposed by at least three-fourths of the members present; when they only put through a half of that for which they solicited their power; and when one is very positive that had those members actually been present, whose proxies were responsible for this power, they would have voted otherwise; what else is it but a farce, and a disgraceful one, to be held under the name of the Holstein-Friesian Association of America?

This is not the first such occurrence chat the Holstein Association has experienced. Previous meetings have found the balance of power in someone's hands and that person or persons have more than once been a minority of the members present. The system which permits such an abuse is wrong, and it, rather than any one man or group of men, should be most criticised.

No criticism should be directed toward the New York State Association for conditions existing at the meeting. Rather commendation is due them for the excellent arrangements they made for entertainment and for business. Those who came early had an opportunity to see some of the good Holstein herds and many points of interest within comfortable driving distance of Syracuse on Tuesday; the meeting was well housed, an excellent banquet was served on the evening of June 1st, and a most enjoyable trip through Northern New York to the Thousand Islands planned for those who would remain for June 5.

The meeting itself, with over 500 members present, was held in the Mizpah church which, we venture to say, never housed such a stormy session before, and doubtless never will again.

Chancellor Day of Syracuse University, who is well acquainted with Holsteins both at home and abroad, opened it with an excellent address of welcome.

President Aitken then briefly enlarged on his printed address, a part of which was published in Hoard's Dairyman of June third. He has, of course, been director of extension as well as president and in the former position has had to experience much of the strenuous work which goes with that office. The extension work of the association has meant that at least four times as many people today are acquainted with black and whites as four years ago, no mean accomplishment.

He spoke of the good work accomplished by the Advanced Registry office and urged its support by everyone and in closing cautioned every member present to consider well the welfare of the association, not individual preference, before casting his vote or votes on any question; much needed and but little heeded advice.

After a reading of the reports of officers and minutes of the last meeting were waived, J. M. Hackney of Minnesota touched a match to the fire works by introducing a resolution commending the action of the officers and directors in pushing the Cole-Cabana case as rapidly as the courts would permit and their direction of association affairs generally.

If this were intended to force the fighting into the open and make everyone declare his stand, it certainly succeeded. Judge F. M. Peasley of Connecticut, leader of the triumvirate who controlled the meeting, took the stand that the resolution was ill timed. He apparently considered the board of directors illegally elected and manifestly was not in sympathy with the then present administration's work.

J. S. Van Gorder of New York moved to table the resolution, in other words to turn it down. This was done by a vote of 7,963 to 5,788; F. M. Peasley, C. N. Newman, and A. L. Brockway voting well over 6,000 of the 7,963 votes. As a matter of fact, the proxy committee's report gave these three men a total of 6,250 votes about evenly divided, and ably assisted by J. S. Brill of New York with 616 votes, they had a very workable majority of the total 13,284 votes of the meeting.

Five amendments making minor changes in the by-laws were adopted without discussion but one slightly increasing the president's power and another giving the board of directors power to amend the by-laws were tabled.

QUEEN PIEBE ROSE, OWNED BY KIRKPATRICK BROS., WISCONSIN

This cow has just completed a seven-day test at 5 years, producing 532 lbs. milk containing 25.4 lbs. fat. She is now on yearly test and is giving her weight in 4.2 per cent milk every 18 days. She has a 2-year-old record of 400 lbs. milk and 14 lbs. fat in seven days, and a 3-year-old record of 523 lbs. milk and 20.64 lbs. fat.

Following these Mr. Peasley introduced his resolution to rescind the action of the St. Paul meeting giving the board of directors power to investigate the question of selecting a national home for the association and act as they saw fit on the same. This was one of the three main points on the strength of which Messrs. Peasley's Brockway's, and Newman's proxies were solicited, but in spite of this they permitted its defeat without a roll call vote where they could surely have won.

As a matter of fact, it is probably true that the board of directors did not need the St. Paul resolution to give them this power and since the 1920 meeting they have certainly taken no steps to make such a change.

H. C. Reynolds of Pennsylvania presented a resolution directing the officers and directors elected at this meeting to proceed with the Cole-Cabana case as rapidly as possible. Jas. Reynolds of Ohio, followed by others, objected to this because of the words "at this meeting" and finally, on the motion of J. B. Irwin, Minnesota, it was tabled and the meeting then adjourned until Thursday morning.

Those who read the call to the meeting and more especially those who received letters from Mr. Brockway, and possibly from others soliciting proxies, will remember that A. L. Brockway was to present an amendment providing for a reduction of transfer fee from $1.00 to 50 cents, a half of this to be returned to the club or association of the state from which it came.

Thursday morning this was scheduled for the first order of business but Mr. Brockway introduced only half of it, that part relating to the reduction of fees, and did not attempt to introduce anything pertaining to returning a part to state associations, although with the voting power at his command this could as easily have been passed.

There was a bitter attack on the proposed amendment by several speakers who contended that such a cut would automatically mean a discontinuance of all extension work and furthermore that the present $1.00 figure was low, both the Jersey and Guernsey fees for similar service being from two to three times as high. H. V. Noyes, New York, showed by actual figures taken from the auditor's report that the fifty cents' fee would just a little more than permit the association to break even without any extension expense.

The resolution passed easily 7,797 to 5,539, although over 80 per cent of the members actually present voted against it, Peasley, Newman, and F. L. Parmalee (Mr. Brockway leaving on personal business turned his proxies over to Mr. Parmalee) holding their control.

An amendment introduced by Gen. Wood for E. A. Powell, New York, to permit a seller to reserve the ownership of a calf carried in dam at the time of sale was defeated.

Throughout the meeting, members generally felt that the present proxy system of voting could not be continued in the future because it is subject to just such abuses as were in evidence there where two or three men with a large number of proxies solicited for certain purposes could prostitute them to other uses at their will. The amendment introduced by Howard C. Reynolds of Pennsylvania to district the country according to Holstein population and elect the national directors by districts, crystallized this sentiment and after considerable discussion this amendment was tabled in favor of a motion by J. M. Hackney to have a committee of Mr. Reynolds, Judge Kellogg of New York, and one other, work out a plan to correct this evil and submit it to the next national meeting.

Judge Peasley then introduced a resolution to keep the association officers in their present location until further action by some future annual meeting. It passed unanimously.

John M. Kelley of Wisconsin introduced a resolution to have a committee of two appointed to look into the advisability of forming a company of Holstein men to popularize and improve the market for Holstein milk and dairy products. This together with one condemning the retouching of Holstein photographs also introduced by Mr. Kelley, were both passed without discussion.

It was evident from the first that the Big Three or Four did not approve of the then present administration and were there to oust them but if anyone present doubted it, they were speedily set right when the election of officers commenced.

After Judge Kellogg nominated D. D. Aitken to succeed himself as president, Judge Peasley nominated Ex-Gov. Frank M. Lowden of Illinois, although many members present (friends of Mr. Lowden) declared that within the past 24 hours he had positively declined to consider the office. Upon questioning, Judge Peasley stated that he had good authority to believe Mr. Lowden would accept, but declined to name his authority.

It was apparent that a majority of those present feared the president's office might become vacant by resignation should Mr. Lowden be elected, and in consequence an undesirable vice-president be in power, so they urged a compromise ticket with Lowden for president and Mr. Aitken vice-president, but this Judge Peasley refused.

Frank O. Lowden was elected largely by the proxies held by Peasley, Newman, Parmalee, and J. S. Brill, New York, solicited for other purposes, the vote standing 7,567 to 5,805 with 271 of those present voting for Aitken and 65 for Lowden. An amusing incident occurred on announcement by the tellers that Mr. Aitken was elected by a 348 majority with 5,805 votes. The crowd was in an uproar at once, giving cheer after cheer to the discomfort of the all powerful minority, but when they finally came to order it was found that Mr. Parmalee, through an oversight, had not been credited with the Brockway proxies. Upon the advice of Mr. Aitken he requested the meeting to credit those proxies to Lowden with his vote, which was of course allowed, and Mr. Lowden declared elected.

Judge Peasley then nominated Geo. Stevenson of Pennsylvania for vice-president and W. S. Moscrip nominated J. M. Hackney to succeed himself. A roll call of the four men, Peasley, Newman, Brill, and Parmalee elected Mr. Stevenson without a call for the other votes.

Wing R. Smith for treasurer, F. L. Houghton for secretary, and Malcolm H. Gardner for superintendent of Advanced Registry were elected unanimously.

Judge Peasley then nominated the four new directors: Dr. D. B. Armstrong, New York, to succeed Horace Norton, Jr., Michigan; John M. Kelley of Wisconsin to succeed Geo. Van Hagen of Illinois; T. E. Elder of Massachusetts to succeed H. A. Moyer of New York; and Mr. Fred Pabst to succeed himself; and by the use of Messrs. Newman, Parmalee, and Brill, proceeded to elect them as he did the

vice-president with a short roll call. Mr. Pabst was elected unanimously.

He then introduced a resolution to change the officers' salaries but this was declared out of order and the ruling sustained by the house.

Upon motion of President Bigler of the New York State Association, Kansas City, Mo., was selected for the next convention.

It is interesting to note that at the directors' meeting late on Thursday, the three new directors, Jno. M.Kelley, Dr. Armstrong, and T. E. Elder, objecting to their manner of election, resigned. The remaining directors then filled their vacancies by appointing them to the respective positions. Horace Norton, Jr., of Michigan, defeated by Peasley & Co., was appointed by the board of directors to fill the vacancy caused by the resignation of Dr. Davis of Nebraska.

The Cattle Show

New York breeders offered a $500 prize for the best state herd to be selected from among the sale cattle and on Tuesday after going over the line-up before a crowd of 500 or 600 interested spectators, Judges Bob Haeger and Ward Stevens put the Michigan herd first with the Pennsylvania consignment a close second and those from Canada third.

In the individual cow class, Spillane's (Michigan) Rosie Mercedes Butter Boy stood first, W. F. Brown of Pennsylvania won second on a very good entry, and A. H. Tuttle's, 20-lb. 2-year-old shipped from Washington, third.

The Banquet

When 1,000 people sit down to a banquet table when they are well served, and later well entertained by good speakers, it must be a successful banquet. That is the kind the New York breeders provided for the National Association members and visitors the evening of June 1 and they should be given full credit for its success.

Following C. F. Bigler's introduction, Master of Ceremonies J. M. Hackney took advantage of the opportunity to invite Holstein breeders there to attend the National Dairy Show next fall and gave them an idea of the possibilities for the Holstein cow in the great Northwest.

Toastmaster Frank O. Lowden spoke of our present industrial situation and insisted that we cannot expect any general return to prosperity until agriculture which today is most depressed is again in gear with other industries.

Jno. M. Kelley, Wisconsin, gave an instructive talk on the necessity of better marketing organizations and more advertising for a more successful dairy business.

He was in turn followed by E. J. Cattell of Pennsylvania, a most entertaining speaker. D. D. Aitken was to have spoken also but because of the lateness of the hour simply wished everyone "Goodnight".

The following is the resolution offered by J. M. Hackney early in the meeting and tabled largely by vote of Peasley, Newman, and Brockway:

The Holstein-Friesian Association of America has, because of the black and white cow, become the strongest and largest organization of its kind in the world. We recognize the foresight and courage of the founders of this great organization, many of whom are living and with us today. The influence of this great organization is world wide. Through good management in the handling of the black and white cow it has become practically the dairy industry of the United States. We are passing through a period of readjustment due to the world war. Wisdom must be our watchword. Any mistake we make now will take a long time to overcome. Under the guidance, wisdom, and management of President Aitken and our present officials, board of directors, we have made a remarkable progress. We regret the unfortunate situation known as the Cole-Cabana controversy and the litigation in connection therewith. We commend the vigorous action of those officers and directors who have fought to preserve the integrity of our records and we urge that this most important matter be carried to a successful conclusion, realizing that the preservation and integrity of the records made by the black and white cow are the basis of the industry.

Cooling Milk

A trip into any market milk producing territory shows a variety of methods used in cooling the milk; some good, some poor, others indifferent. Below are given the results of five different cooling tests taken under normal conditions.

The first test consisted of cooling milk by means of a common wash tub and water. It required one hour and ten minutes to cool a can of milk from 96 degrees to 60 degrees, the temperature which is considered safe for market milk. The water, which had a temperature of 48 degrees, was changed five times and the milk was stirred occasionally. It is plainly evident that this method is costly and impractical.

The temperature of milk, cooled by means of the "half barrel" method, was reduced from 96 degrees to 60 degrees in 45 minutes, during which time the water was changed twice. This method would also be impractical for large milk producers.

A concrete tank, about two and one-half feet by six feet, was used next. Twenty-five minutes were required to cool the milk to 60 degrees with water testing 50 degrees. The milk was stirred two or three different times. This method is the one most commonly used and gives good satisfaction if enough time can be spent on it.

An aerator or cone shaped cooler was next tried. Running water was used, the flow being obtained by a gas engine and pump directly from the well. The water had a temperature of 50 degrees, the milk 96 degrees. In order to cool the milk to 60 degrees it was necessary to run it over the cooler twice. On the first time over the temperature was reduced to 62 degrees and on the second time to 54 degrees. The total time for cooling was fifteen minutes.

A coil or "corrugated" cooler was used in the next trial. Running water is necessary with this cooler. By running milk which had a temperature of 96 degrees over the cooler once the temperature was reduced to 53 degrees. This particular cooler, which was one of the smaller sizes, could take care of milk as fast as four men could milk it.

For producers sending any considerable amount of milk to the city, this one seems to be very economical and efficient.

It should be impressed on the mind of every milk producer that temperatures cannot be guessed with any degree of certainty. If an investment of $1.25 for a dairy thermometer is the means of saving even one can of milk during the entire summer, it is a paying one.—Flint, Michigan, Milk Letter.

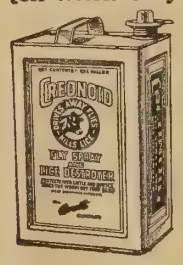
Spray chicken roosts and drop boards with Creonoid to get rid of mites and lice.

Chicken Mites and Flies—

IF your hens are not laying well chicken mites are probably to blame.

These pests hide by day in the nest boxes and woodwork in the henhouse. At night they feed on the hen's blood. This loss of blood so weakens the hens that they often become easy victims of some simple disease, and do not lay as well as healthy birds.

The surest, easiest and cheapest way to get rid of mites is to spray thoroughly the inside of the chicken house with Creonoid. You will be surprised how soon your hens will begin to look better and lay better



Spray your hen houses with

CREONOID

FLY SPRAY AND LICE DESTROYER

CREONOID is unequalled as a fly spray. Fly-tormented cows give less milk. Fly-tormented horses do less work. Creonoid keeps the flies away. It means animal comfort and bigger farm profits.

Lice-infested hogs decrease profits. They are hard to fatten when they are constantly scratching against the rubbing post. Creonoid relieves the torment of the hog lice, and increases pork production.

Creonoid is safe, lasting and does not gum the hair.

It's Safe to Use Creonoid

Creonoid is not an experiment. Thousands of farmers have been using it for years with splendid results. It is made by The Barrett Company, which, for more than half a century, has been America's leading manufacturer of coal tar specialties.

Creonoid comes all ready for use in 1 gal. and 5 gal. cans; also in 50 gal. barrels.

If your dealer doesn't carry Creonoid, write to us and we will see that you are supplied.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

June 22-25—Tuberculosis Eradication Conference, State House, Boston.

Sept. 26-Oct. 2nd—Dairy Cattle Congress at Waterloo, Iowa.

Oct. 8-15—National Dairy Show at Minnesota State Fair Grounds. Manager, W. E. Skinner, 910 So. Michigan Ave., Chicago.

Coal ashes have little value as fertilizer, their use being mainly to loosen the soil and make it more workable. They are most valuable on heavy clay soil, but should be screened to take out coarse material before they are applied, and should be spread evenly over the surface and thoroughly mixed with the soil. Wood ashes have fertilizing value, but should be applied before they become leached.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, June 6—The sudden decision of the House Committee on Agriculture to take up the two matters of legislation, filled milk and cold storage, of special interest to dairy interests, had three causes: that these matters were already pending before the committee, several members of the committee have personal interests in the dairy business, and third, and controlling, it was thought both of them could be taken care of in the brief time likely to elapse before the tariff bill is reported, and drive everything else out of consideration until it is passed.

It was the insistence of Congressman Voigt of Wisconsin that led the committee to vote a hearing to his bill, and he will have charge of the hearing held June 13. As has already been indicated in this correspondence his bill is the simplest and most direct way of dealing with this problem. He provides plainly that milk from which cream has been taken, and some other fat substituted, is "adulterated" within the meaning of the pure food laws, and its manufacture and sale are prohibited. Up to this time one other bill has been introduced on this subject, a bill by Congressman Beck of Wisconsin, which deals with the problem along the same lines that the filled cheese law was drawn and passed, that is by manufacturers' and vendors' license tax, and a flat pound tax, the joint result of which is prohibitive. The Beck bill, however, was referred to the Ways and Means Committee, as it is, in form, a revenue measure. Unless the reference can be changed this bill and this form of dealing with this problem will not be before the Committee.

It is likely that the exact form which regulatory or even prohibitive measures may take will not be the principal topic at the hearing, but that the time will be taken to show first the magnitude to which this manufacture and sale of imitation milk has grown; and, second, the lack of vital food value in the imitation product. Congressman Voigt plans to call Professor McCollum, the leading expert in biochemical food science, representatives of the McCormick Memorial Association, as well as representatives of milk producers and condensery interests.

Excepting the manufacture of filled milk and imitation cream, and perhaps ice cream, there is not expected to be any strong opposition to legislation on the subject of "filled milk" here. This is not true of the cold storage legislation which is before the Agricultural Committee, to be taken up the next day after the filled milk hearing. This legislation before the committee is in the form in which it was reported at the last session, when it was expected to pass. At the last moment protests from Pacific Coast poultry and creamery interests halted it, and now it appears that middle western creamery interests are also opposed.

The opposition comes from the fear that marking dairy products with the words "cold storage" as is provided for in the proposed law, even if they have been in storage a very brief time and are not injured in any way, will put these products at a marked disadvantage in competition with margarine. The poultry people claim that the original bill made them mark their products when their only period of storage was the period of transit in refrigerator cars.

It can be stated positively that it is not the intention of any member of the committee to injure any business with this cold storage law, but it is the intention of the committee, if possible, to have products sold for just what they are, marked as storage products if they are in fact storage products; that is, if they differ in flavor or quality in any way through storage. The producers of fresh products are entitled to this protection by the law in the opinion of the students of this question. Then, too, there is an economic necessity which has more or less weight, in a limitation of the time products may be held in storage, the basic principle being that the storage should be used only to permit distribution of a product over a single calendar year.

Chairman Haugen has heard many protests against the last year's action of the committee, especially from small creameries, and has asked your correspondent to make it plain that he wishes the views and necessities of this industry to be fully placed before the committee.

⚜

Much new information is now available as to the imports and domestic use of vegetable oils, in the late reports of the Census Bureau, the reports of the Bureau of Foreign and Domestic Commerce, Department of Commerce, and the studies of the Dairy Division and of the Division of Foreign Markets of the Department of Agriculture. This is coming out in ample time for use in the debate on tariff on vegetable oils, which will break loose as soon as the bill is reported. This bill will go down in history as the Fordney bill, or the Penrose-Fordney bill, depending on what happens to it in the Senate, and is due for the first light of public inspection now within a few days. There are some indications that if it is not out by June 15, when last promised, that it will come by the end of the week of the 15th anyway.

⚜

Congressman McLaughlin of Michigan is one of the members of the House who is familiar with dairy problems. Your correspondent called on him recently to discuss the various questions likely to come up in the filled milk discussion, and found him with a file of Hoard's Dairyman in front of him, going over the recent articles and editorials on this subject. "I take Hoard's regularly," he said, "and it is one of the few publications, outside the newspapers from my own district, that come to my office for my regular information." Alongside the copies of Hoard's Dairyman he had a set of Holstein-Friesian registry papers, and some photographs of a fine looking Holstein bull calf, from which photographs he was transferring the markings to the registry papers, preparatory to making application for registry for this addition to his own Holstein herd. The next document of interest was a letter from Congressman McArthur of Washington, containing the milk and butter records of Congressman McArthur's herd of registered Jerseys—a mighty fine herd record it might be said in passing—and evidently an effort to draw the Michigan Congressman into a contest as to the respective merits of the two congressmen's herds as to production and profit. Men, with these interests in dairying, are to be depended on to see that whatever is fair to this great interest is given it by Congress.

Filled Milk Fight Won

Wisconsin Senate Gives Unanimous Vote

Filled milk is dead in Wisconsin. At least its manufacture and sale in that state will cease ninety days after the governor signs the bill that has just passed the state legislature.

It was a hotly contested fight from start to finish, but the farm organizations presented their case so well that the bill passed the assembly by a vote of 67 to 10, and on June 7th the Senate gave its unanimous approval. The manufacturers of the imitation product sought by every means in their power to stem the tide running against them, but all to no avail.

Because few farmers attended the first hearing before the Assembly Committee the word was put out by the manufacturers that real farmers were not interested despite petitions and letters signed by thousands of the best dairy farmers of the state. To meet the possible effect of this propaganda, farmers were asked to attend the hearings before the Senate Committee, and later the entire Senate. They left their work, many with haying in progress and every hour lost from the field was a decided sacrifice. Some three hundred attended the last hearing and their presence was a large factor in securing the unusual and unexpected unanimous vote of the Senate.

Credit for the passage of the bill is due to the co-operative working spirit of the farm organizations, and the splendid support of many members of the legislature. This legislation was first proposed by the Wisconsin Dairymen's Association and Hoard's Dairyman but the State Farm Bureau Federation had direct charge of the fight and showed the power and influence of this organization in presenting the cause of the farmer. Many individuals gave freely of their time, but any statement of names would make several columns of reading matter and yet fail to do justice. It was team work that won the fight for honest dairy products and the protection of the dairy farmer's interests.

With the fight won in the biggest dairy state, it now goes to the Congress of the United States with high hopes for success. As to its present status there, see the Washington Weekly News in this issue.

Pure-bred Cattle

The census of 1920 credits the state of Maine with a total of 15,683 pure-bred dairy cattle, of which number 12,172 are females. The various breeds are credited with the following number: 1,134 Ayrshire, 62 Brown Swiss, 1,836 Guernsey, 7,206 Holstein, 4,999 Jersey and 446 other breeds.

The state of South Dakota is credited with a total of 5,248 pure-bred dairy cattle, of which number 3,704 are females. The various breeds are credited with the following number: 85 Ayrshire, 119 Brown Swiss, 135 Guernsey, 4,027 Holstein, 312 Jersey, and 570 other breeds.

The state of Nebraska has a total of 7,873 pure-bred cattle within its borders, of which number there are 5,922 females. The various breeds are credited with the following number: 74 Ayrshire, 38 Brown Swiss, 348 Guernsey, 5,368 Holstein, 1,275 Jersey and 770 other breeds.

Every good merchant has a "want list" on which he jots down articles he needs to order. A farmer might use this system for listing odd jobs that need doing.

National Holstein Sale Averages $807

The New York Holstein breeders planned the Second National Co-operative Sale for June 2-3-4 at the Syracuse fair grounds, but a two-day meeting instead of the one planned for the national association forced them to run the sale through in two days.

In spite of this and in spite of the turbulent meeting which many predicted would seriously affect the sale, it was very good. There were no such prices as at St. Paul a year ago, but in most cases the cattle brought a good fair figure, and we believe New York should be credited with a successful sale.

One hundred seventy-one animals sold for $138,000, just over an $807 average, with 16 bulls bringing an average of $1,304, and the females, $759.

Forty-six head sold for $1000 or more each, with $4,250 the top price. M. Montgomery of South Carolina paid this for a splendid 30-lb. seven-year-old daughter of O. K. L. consigned by Geo. Abbott of New York. Julius Schmid offered to take her to Beaver Dam Stock Farm to complete her year record and breed her to his Ormsby Sensation free of charge and if that was accepted offered $3000 for her resulting calf, bull or heifer. This, of course, made her a cheap cow at the $4,250 price.

A son of the same sire was the highest priced bull at $2,800. He was nine months old, from a 31-lb. 4-year-old daughter of King Segis De Kol Korndyke, and consigned by Henry Morgenthau, Jr., New York. He will head the herd of J. H. Rakestraw, Pennsylvania.

The consignments came from fifteen states and Canada, the buyers from sixteen different states.

The buying states, number of buyers from each, and the number and average price of their purchases are as follows:

State	Buyers	Animals bought	Ave. price
New York	42	88	$ 700
Pennsylvania	10	19	979
Ohio	6	10	815
Michigan	4	8	702
New Jersey	4	7	1415
Maine	1	7	403
Wisconsin	3	6	1040
Missouri	1	6	834
Connecticut	1	5	441
Massachusetts	2	2	1527
Minnesota	2	2	880
Vermont	2	2	792
South Carolina	1	1	4250
North Carolina	1	1	1825
Illinois	1	1	1025
Kansas	1	1	365

Mack, Haeger, Kelley, and Baxter did the selling with Wood in the box.

The following list includes all animals selling for $750 or more and buyers:

Herbert Gay, New York
- Belle Model Sylvia $900

Jas. Male, New York

EDITORIAL COMMENT

JUSTICE DEMANDED

A subscriber who desires justice for patrons of a certain creamery writes: "Can you give me some pointers how to make dishonest people do the fair thing?"

This reminds us of a story a lawyer once related at a farmers' institute. He was discussing laws, their applications and their limitations, and to give as an illustration of what law could not do he cited this incident in his law experience: A farm boy, of some 18 summers, came to his office and hesitatingly entered his sanctum. He showed deep concern and was much embarrassed as he approached the lawyer.

"Well," said the lawyer, "what can I do for you?"

"I have come," said the boy, "to get you to pass a law that will make pa more decent to ma."

There are laws that protect society from brutal treatment, stealing, and the like, but no law can make "pa decent to ma" or an unfair man fair. Surgery may in time become so perfected that operations will be formed upon the brains of the indecent and the dishonest as this is the only cure for such individuals. In the meantime the best we can do is to pass new laws to cover new crimes and to enforce the laws we already have on our statute books that the unfair and indecent actions of such persons against society will be minimized.

ORGANIZATION FOR SELLING MILK

Twenty years ago the following editorial paragraph appeared in Hoard's Dairyman: "We have repeatedly urged the milkmen, who send their milk to large cities, to organize themselves into compact working bodies, and build a creamery at each shipping station. Then they would have, instead of one way, two ways for disposing of their milk. It ought to be just as practicable for milk farmers to run a co-operative creamery, as for farmers in other parts of the country. If this feature were carried out, the milk dealers in the cities could not combine as they do now to pay such low prices for milk."

It is encouraging to note that in the past five years the milk producers have combined in practically all sections supplying large cities with milk, and creameries and other agencies for handling milk in some instances have been built and plans are being laid to build more institutions owned by milk producers for the purpose of caring for their milk. It has taken much agitation and the organizers of milk producers have experienced much grief to accomplish what has been done to improve the method of marketing milk. The work should continue till the milk producers have their business as well organized and upon as efficient a basis as the milk dealers. The time will come when the milk distributors will prefer to deal with well organized and managed co-operative concerns rather than with the individual farmers.

EARNING OR GETTING MONEY

To earn money is honorable, for it means a useful service has been rendered, but to get money cannot be held to be right and leads to bad results. We sometimes think a great deal of our present condition can well be attributed to the desire to get money, that we have concentrated our efforts upon getting money rather than upon earning it. Our economic conditions have been such that many people have found it easy to get money and the more they have, the more they desired and the more they resorted to practices which cannot be commended as being good. This game has been played with such vengeance that it has had a depressing influence upon everyone and there has come a discontent altogether too general and a distorted vision of what constitutes real development. We believe this condition of affairs applies to every class, but it is not our purpose to discuss other enterprises so much as our own.

The breeder who takes pride in the development of the best cattle, who measures his success by the cattle he breeds, is taking the right attitude toward his business and in the end will gather the richest reward for his services and skill and will have the greatest enjoyment. The person who breeds cattle just because he desires to get money and builds all effort toward that end will, on the whole, get neither money nor contentment. It is the duty of the breeder to improve the blood of dairy cattle that they may render a better service to the dairy farmer and to those who may purchase them for both dairy and breeding purposes.

If we are to receive the largest reward, to obtain the greatest happiness, and to build the best breeds of cattle, we must concentrate upon rendering skillful and efficient service. Laws, rules, and regulations will not do it. They may be necessary to provide conditions under which useful service may be rendered, but that is their only purpose. To enrich ourselves, to improve our industry, we must be more concerned about improvement and excelling in our efforts and skill than we are about getting money.

COWS AND BOYS

The most unpardonable sin in connection with American agriculture is the poor cow. She is omnipresent and rampant. She is, "the pestilence that walketh in darkness; * * * the destruction that wasteth at noonday." Tireless and unceasing in activity, she holds the farmer down to ceaseless routine of toil from the first day of January to the last day of December in each year, whereas he should, of all men, have the fewer hours of labor and the most holidays, for he has as helpers all the forces of earth and sea and sky.

It is held that at least one-third of the cows in the United States do not pay for feed consumed. This means wasted feed, wasted time, and wasted opportunity. If poor cows meant the wasting of feeding only it would not be so bad, but for a person to spend his time, and his family's too, upon unprofitable cows amounts to an unpardonable sin. The poor cow affects the entire industry, for what she produces assists in depressing the prices of dairy products. No one seems to be at all concerned about this problem in our dairy industry when it has one of the largest influences upon its development. Cow testing associations are far more important to the advancement of the dairy than is generally comprehended. They are the agencies which are revealing to the farmer the waste of poor cows and the advantage of keeping good ones.

Boys raised on the dairy farm are entitled to the opportunity of caring for good cows. The caring for good stock gives the boys a chance for gathering usual information and creates a deeper interest in all the activities of the farm. It is nothing more or less than wicked to take away from a boy on the farm the opportunity of associating with good cows. If the father desires to waste his time with scrubs he perhaps should have the privilege, but he has not the right to waste his boy's time or his opportunity.

Let us all pull with a will to eliminate the poor cows.

WAITING FOR MONTHLY CHECK

Some members of co-operative marketing associations complain because they do not receive pay for their products as promptly as they desire or as soon as private enterprises pay. It is rather a common practice with privately owned creameries to pay for fat, delivered to them in May, by the first of July. Some centralizers pay for fat when the cream is delivered. Milk distributors and condenseries make it a practice to pay for milk received in the previous month on the 15th of the following month.

If the patrons of co-operative enterprises desire that they be paid on the 15th of the month for the milk or cream delivered the previous month, it will be necessary to establish a fund for that purpose or possibly issue certificates of indebtedness which can be discounted at the bank. At the present time this would cost from 6 to 8 per cent for the period which the certificates of indebtedness are drawn.

There is nothing unusual in requiring a patron to wait 60 to 90 days for his pay when he delivers milk to his own co-operative institution. It must be borne in mind that it is his product, his institution, and his business, and he is simply waiting for those who purchase his manufactured product to pay for it so that the money may be divided among the several patrons. Those whom he has placed in charge of such a co-operative enterprise do not have the power of borrowing money unless they are so directed by the patrons.

If the producer desires to manufacture and market his own product, he must bear in mind that he must either raise money for paying himself as private institutions pay or he must wait until his product has been sold and the money received for it. Large business enterprises go to banks and borrow money for this purpose unless they are in very strong financial condition. In most cases it is to the farmer's advantage to wait for his money because of the saving he makes by waiting.

THE COW HERSELF

Slowly it is breaking in upon the comprehension of the minds of average dairy farmers that there is a mighty wide difference in cows. Here let us say that it is just that very idea of difference that constitutes the foundation of the breeder's work. To produce a better cow, and make the difference as great as possible between her and the average cow, is his mission. Everything in this world is governed by that self-same principle. Christ established Christianity by obedience to this law of difference in men, and chose His apostles, not by accident or position in society, but because they were sufficiently different from other men to be permanently fit for the work He designed them to do. The law of difference is a mighty force in swaying the destinies of men and he is but a child among men who does not recognize it and take advantage of it.

It is a law governing the fortunes of dairy farmers the same as it does the fortunes of a general of an army. If he does not select his officers and men wisely, he will win no victories. If the dairy farmer does not secure good cows he is soon "played out". Hence it is all important that he be well versed in "cow sense". He must know how to breed a good cow. Breeding is a science he must study. There is no help for it if he is to prosper. To study signifies that he must be a reader of what other men have done and written. He should also be a writer. He should air his ideas. If they are wrong, and of a kind that will cost him dearly, he will find it out. No man ignorant of what other men are doing can go into the most successful partnership with the cow.

Colors That Disqualify Holstein

If a Holstein bull calf shows reddish black, do you consider such an animal pure-bred and entitled to be registered, even if both of his parents were registered pure-breds? My idea is that a red bull was first used on the mother and left his strain in her.

Newport News, Va. W. C. R.

The markings which bar from registry in the Holstein-Friesian Association, even though an animal is descended from registered parents, are as follows: Solid black; solid white; black switch;

solid black, with white on belly only; black on legs, beginning at feet and extending to knees and hocks; black on legs, beginning at feet and extending to knees, with white interspersed; grey, or mixed black and white, generally prevailing; patches of other colors than black or white: red, brown, dun, etc.; red and white.

The cropping out of red in Holsteins is not frequent, but it is not unusual. That is, there is occasionally an animal born with red color on its body. This is due to the fact that the original Holsteins were red and white as well as black and white. The first Holsteins imported into America were, however, black and white and they attained great favor. For this reason the color distinction was drawn and has always been insisted upon. The breaking out of the red color is only an indication of certain principles of breeding. It is quite possible that a Holstein may be born with red color whose parents for many generations back have been black and white, but somewhere in its pedigree there has been a red Holstein.

The theory has been exploded that where a cow is served by a bull of another breed or color, a succeeding calf from another sire may be influenced by the previous service. None the less the thought prevails in many minds that this is a fact but there is no evidence to support the claim.

Making Hay Caps

I would like to know how to make hay caps. I have quite a lot of clover hay and will have to cover it as we have a lot of rain.

Espyville, Pa. J. H.

"A" sheeting, 40 inches wide, and heavy canvas make suitable material for making hay caps. A cap 40 inches square is large enough. We have used the Dwight anchor sheeting which may be obtained from any dry goods store. If it is not in stock the merchant will undoubtedly be willing to order it for a customer.

It is not necessary to hem the caps. This is extra work and is of no advantage. Weights are attached to each corner of the cap by a string. A weight of 8 ounces or more is none too heavy and will hold the cap on better than a lighter weight. A very satisfactory weight can be made of concrete, inserting a staple in the weight before the concrete hardens. The staple gives opportunity for tying the weight with a string to the corners of the cap.

The best grades of sheeting used could be purchased, a few years ago, at 15 cents a yard, but now the price for this material is considerably higher.

Cabbages for Early Spring

HOARD'S DAIRYMAN:—Cabbages, with their palatable succulence, helpfully modify the diet of dairy cows. Early in spring, cows that have been fed heavy rations of concentrates and corn silage often become clogged and sometimes refuse to eat. Cabbage, beets, turnips, carrots, or even potatoes are then better relished than regulation winter feed. Alkalinity of cabbage, beets, and carrots, the other mineral elements and qualities which they contain, peculiarly differ from the acidity and natural characteristics of corn silage. They produce a desirable effect on the cow's system, resembling, yet preferable to, that of medicinal drugs, while in themselves a substantial feed.

A few hundred head of cabbages and a few bushels of roots make satisfactory returns for trouble of storage when jaded appetites need a tonic derived from variety of diet. Spring seedtime is the time to prepare for next season's feed supply.

New York. C. F. MYER.

[EDITOR'S NOTE—Experimental work has been done which indicates that there is a relation between a cow's storage of calcium (lime) and whether she is fed the leaves from green growing plants or such feeds as cabbages and rutabagas. The ensiling process seems to take out some of this peculiar virtue which is found in the green growing plant but is not found to any considerable extent in the silage. Professor Hart, who has charge of these experiments, inclines to the belief that this may be another form of vitamine, similar in character to the other three vitamines now generally admitted to be important diet accessories. His experiments have not been complete enough to warrant general conclusions and so far have all been made with milch goats. However, he has found that he can put a milch goat in a negative or positive calcium balance according as he feeds cabbages or green growing plants or does not feed them. It is felt by some scientists that because the cow cannot assimilate enough calcium from her ration to make up that used in the production of milk and in the growing of her calf, that she draws on her own system for this calcium and it renders her less able to produce milk in the succeeding lactation period if not in the one immediately concerned. Lack of ability to assimilate calcium, even when fed heavily on it, is one of the limiting factors in large milk production and, possibly, in the fecundity of dairy cattle.]

Ten Cent Milk in Louisiana

HOARD'S DAIRYMAN:—I am one of your ten-year subscribers and I always enjoy your valuable paper. In your last issue you have two cities in the United States listed where milk is sold at 10c per quart. You can add another—Morgan City. Here is how it is done and it might be a lesson to some of my poor dairy friends.

When spring started and the clover started to grow, the first thing was a surplus of milk, so I bought a small steel barrel churn and added butter and buttermilk, which created a demand for six fresh cows. Then I bought a small Sharples separator and a carload of beet pulp and alfalfa hay meal. I believe it was the first car of pulp in the state.

I had quite a market for butter until the bottom fell out of the market, so I made up my mind to put the price down to where the children could drink more milk. I engaged room in a grocery to handle my milk on a commission basis and withdrew my three delivery wagons and dropped the retail price from 18c per quart to 10c per quart cash, if you bring a bottle. I have simply turned another surplus into another shortage.

I have added six more fresh cows purchased this week and, besides, I have five new calves born this week. I am preparing to handle 10,000 quarts in June and I am looking for another six fresh cows.

I have a lumber mill near where I send milk every day to the laborers for their dinner at 5c per pint. I have only a small dairy and was being worked to death trying to retail my milk at 18c. Now I have plenty of leisure time for everything. Let other dairymen put the price down so the children can reach it with their dimes. There will be no surplus.

Morgan City, La. W. D.

Cost of Producing Milk

Market milk cost on the average 33.2 cents per gallon, $3.86 per 100 pounds, and $213.13 per cow per year on 94 northern Maryland farms surveyed recently by the United States Department of Agriculture in co-operation with the University of Maryland. A preliminary report of this survey, just issued by the Office of Farm Management and Farm Economics, shows that, with an average sale price of 34.2 cents per gallon, 48 of the 84 farmers, or 51 per cent, failed to make a profit over the book cost, with all feed and labor charged at full current rates.

The average number of cows on the farms surveyed was 18.2, and the annual production varied from less than 4,000 pounds to over 8,000 pounds, with an average for all cows of 6,074. Practically all of the milk in question was shipped either to Washington or Baltimore.

Of the total cost of production, about one-half ($121.38 per cow) was for feed, 56.6 per cent of this being farm grown. Grain fed totalled 2,259 pounds per cow per year, 512 pounds of this being grown on the farm. Hay fed totalled 1,793 pounds, practically all home grown. Man labor per cow totalled 291 hours, horse labor 29 hours.

These figures for feed and labor expenditures, in pounds and hours, are considered of greater importance than the costs as expressed in dollars and cents, since the former do not fluctuate greatly from year to year, and may be taken as basic in estimating the cost of milk production in the region surveyed.

A farm business analysis, made in connection with the cost studies, brings out in a striking way the relation between cost of milk production and farm income. It was found that the labor incomes of 15 farms with comparatively low milk costs averaged $1,448 higher than those of 15 farms with comparatively high costs.—U. S. Department of Agriculture.

Uses Soybean Meal for Test Cows—Milk Tests

HOARD'S DAIRYMAN:—About the query of H. E. S., Staatsburg, New York, in your May 6 issue regarding soy bean meal for test cows, wish to say that my personal experience in the last few years has been such that I use soy bean meal to a large extent and successfully. Replaced cottonseed meal with soy bean meal entirely and, to my belief, the cows are better off. Doing this, records of 20 lbs. up on junior two-year-olds, 30 lbs. and up on junior three-year-olds, etc., with over 500 lbs. milk for the first and by a good margin over the 700 lbs. for the latter are the results. But the main factor in this, the animals—although heavily fed—showed strength during any length of test, keeping in the finest of condition, as silky hide, clear eyes, and splendid appetites. I use it also in fitting ration. It should be of value for this purpose.

A. P., De Lancy, New York, comes with a question about milk tests in your same issue to which, I think, you answered partly wrong, or incomplete. Your answer: "A drop in test from 5 per cent to 4 per cent and then up to 4.7 per cent for a herd is very unusual, and must be explained by some marked change in feeding or management of the herd," goes, as you stated, by throwing the bunch from the barn feed on a young pasture; also, as you pointed out, through chilly weather. I will not say that you are wrong in that. But the one and only factor in this case you omitted, and that is the north wind. Keep your cows in the barn, give them the best of care and it doesn't matter, for if a north wind comes, the butterfat test goes tumbling down and nothing can prevent this. The finest weather with the temperature from the north and the trouble begins. This, I have observed from years of observation and experience.

California. R. G.

Work in Dairying

HOARD'S DAIRYMAN:—The dairy farmer may be getting along a little better just now than the grain farmer and the grower of live stock for market purposes, but a survey just summarized at the University of Minnesota shows that he has had to work hard for all he has received and is receiving; in other words, that there are no downy beds of ease on the average western dairy farm.

Accurate detailed labor records were kept by staffmen of Professor Andrew Boss' division for each regular workman on each of 23 farms on Steele County during 1920. The returns, now made available for the first time, show that 38 workmen on the 23 farms averaged 10.9 hours of manual labor every-week day and 5.7 hours every Sunday. Practically every month some farmer worked 13½ or 14 hours a day and in one case 15 hours. One man averaged 15 hours per work day and more than 8 hours on Sunday. The farms are all dairy farms and are also well stocked with hogs.

Minnesota Bulletin No. 117 gives the figures from a survey made 15 years ago in Rice County which adjoins Steele County and has the same system of farming. Fifteen years ago the Rice County farmers worked only 8.9 hours on week days and 3.6 hours on Sundays, against the 10.9 hours on week days and 5.7 hours on Sundays worked by the Steele County dairy farmer in 1920.

There was, of course, more stock on the Steele County farms the past year than on the Rice County farms during the period mentioned, but otherwise conditions were much the same. The length of the week day working day has increased 22 per cent and the Sunday hours have increased 66 per cent in the 15-year interim, and this, too, despite the fact that on the 23 Steele County farms there were in use last year 17 tractors, 14 milking machines, 23 autos, and one auto truck, whereas there was no modern equipment on the Rice County farms. The survey demonstrates, in other words, that present day farmers have fewer hours of leisure than they had before the advent of labor saving machines.

"The fact that more live stock is being kept today than ever before is one reason for the longer working day," says Professor G. A. Pond who was in direct charge of the survey. Another reason is the fact that farm help was expensive and hard to get last year.

Minnesota. E. C. TORREY.

Paint Your Barn with Lead and Oil

For this barn 56x34 with 12 ft. corners and 14 ft. gable, 8 gals. of paint will give it two coats.

To make 8 gals. of pure lead and oil paint tinted a light slate or a warm gray, requires:

100 lbs. CARTER WHITE LEAD
2 to 4 lbs. Tinting colors (ground in oil)
5 gal. Linseed Oil
1 qt. Drier (if raw oil is used)

CARTER WHITE LEAD and these other ingredients of pure paint may be purchased nearly everywhere paint is sold at retail and the dealer will cheerfully help you to figure out how much paint will be required for any painting you wish to do, what tinting colors will be required to produce the shade you select, and what it will cost at present market prices.

You will find everywhere that the cost of this pure paint is so reasonable that you can afford to paint all your farm buildings with it. You will also find **CARTER WHITE LEAD** so easy to mix and spread, to cover so well and to wear so long that your paint problem will be solved for all time.

Carter White Lead Co.
12042 So. Peoria St. Chicago, Ill.

278 Jerseys Bring $324,690

Four Sales of "Jersey Week" Make High Average of $1,168. New Record Price for Cow of the Breed

If money talks, "Jersey Week"—May 30 to June 4—ended with such a clamor as must have resounded 'round the Jersey world. When L. V. Walkley stopped the procession over the auction block at Belleview Farms on Saturday, the four sales of the week had furnished the buyers of Jerseys with 278 head at an average price of $1168 and a new world record value for a Jersey cow had been set.

In their order the four sales were: T. S. Cooper and Sons' of Pennsylvania where 84 head netted $72,025, an average of $857, with $3,500 the top price, that being paid by R. J. Fleming, Canada, for Simone's You'll Do's Fontaine, a grandson of Imp. Oxford You'll Do and Plymouth Lad; Meridale Farms', in which 72 head beat a $1,200 average by $3.33, Golden Cymbeline and her two-day-old bull calf going to S. A. Guy, Louisiana, for $10,000; W. R. Spann & Sons', the 76 head exceeding a $1,000 average by less than a dollar, the total being $76,075; and L. V. Walkley's annual dispersion in which 46 head totalled $89,900, climaxing a week of liberal appraisals with an average of $1,954.

A review of the Cooper auction appeared in the June 10 issue of Hoard's Dairyman and that for Meridale's second annual public offering may be found elsewhere in this issue.

Spanns' Twentieth Semi-Annual

W. R. Spann & Sons' twentieth semi-annual sale June 3 followed Meridale's second. It contained what was adjudged the best lot of individuals ever offered by that importing firm. Not only was the type that which is drawing the highest bids but many cows of unusual size and capacity were included. The exceptionally high average price reached measures the quality of the sale. The high price of the day, $6,700, was paid by Ledge Rock Farm of Kentucky for Cowslip's Manor Girl, a six-year-old daughter of General Cowslip. This farm was the heaviest buyer, taking seven head for $15,375, including $4,500 for a double granddaughter of Imported Golden Fern's Noble.

J. S. Ellsworth paid $7,225 for three head, the top being Oxford's Cunning Mouse for $3,500.

Walkley's Dispersion

When 46 of the 73 head listed for Belleview Farms' sale, June 4, had been sold the total was $89,900, an average of $1,954, which was well above that set in any of the three other auctions. At that point so many blemishes were suddenly discovered in the remaining animals that no more were led in, the management "called it a day", and the year's high point in sale average was maintained. This strategic move, made somewhat earlier, would have done even more in the way of preserving averages.

A new world record price for a Jersey cow was set when J. C. Baldwin of New York made the bid of $18,000 on Gamboge Oxford Gem, an eight-year-old double granddaughter of Imp. Oxford Majesty, a sweepstakes winner in 1918 at the Island St. Savior—Grouville Show, and having a two-year-old butter record of 430.5 lbs. Miss E. Fitzgibbons of Maryland was runner-up with a last bid of $17,500. Though the contender for the world record price cow did not secure the animal, she succeeded in contributing the largest sum toward the sale's total paying $19,300

Wounds Cuts Ringworm Scab

Live stock men fear wounds or cuts on an animal. They know that infection usually follows and death often results. B-K is a concentrated, pure sodium hypochlorite such as is used and endorsed by leading veterinarians, physicians and breeders. It kills the infection germs; cleanses, soothes and heals the tissues.

B-K Bacilli-Kl

is not a poison, acid or coal tar product. Clear and clean as water, it kills the infection germs without pain or discomfort to the animal or burning of tissues.

Proof That Proves
A B-K user in Oso, Washington, says regarding Ringworm:

"We bought a gallon of B-K and took a chunk of gunny sack and went after it with B-K. In three weeks there was not a sign of it left and there has not been a case since. Forget that iodine stuff. It's as far behind the times as wintering cattle on oat straw."

Keep B-K constantly at hand in the stable, milk-house and kitchen. Wherever germs lurk it does its work. Money back if you are not satisfied.

At your dealers in all size bottles.

for seven head including the second and third highest priced animals, Green Farm Sybil for $7,700 and Sybil's Gamboge Katharine for $6,700. F. E. Duffy of Connecticut ranked next to Miss Fitzgibbons in this respect, taking 11 animals for $18,650, his price list being headed with Oxford Majesty's Gipsy 2nd at $5,000.

Saved From the Butcher and Becomes Champion

The previous owner of the Jersey cow, Harmless of Cloverdale, was selling out and practically had disposed of this cow to the butcher. Mr. Chas. B. Whitney of South Carolina, after carefully looking her over, bought her at the butcher's price.

After freshening she was placed on official year's test at twelve years of age, and given a chance to prove that she was worth more as a dairy cow than if divided into choice steaks. That she has lived up to the expectations of her owner is verified by her record of 7,879 pounds milk and 469 pounds fat. She will be placed on test again after freshening and it is expected that she will equal her last record.

This case is just another example of how good cows can be saved from slaughter if prospective purchasers have knowledge of how to judge a dairy cow. This is the oldest Jersey cow ever put on official test in South Carolina.

Meridale Farms' Second Auction Averages $1203

Meridale Farms' second annual public offering of Jerseys at Meredith, New York, June 2, firmly established that institution's claim to eminence in the auctions of the breed. For many years it has ranked among the leaders in its consistent, constructive breeding and its Register of Merit standards. Now its yearly sales give it a new prominence. The first, September 17 last, in which 62 head averaged $803.63, was wholly successful, but the second eclipsed that record fifty per cent in the average value reached and the number of animals sold was ten greater.

Among the 72 animals sold June 2 for $86,640, an average of $1,203.33, was a $10,000 cow and two others for $4,500 and $4,000. Thirty-one animals sold for $1000 or more and only six for less than $500. The two bulls included brought $2000 and $750.

The entire sale list was imported, selected on the Island chiefly by Edmond Butler whose cattle and whose importing and sale business has been purchased by Ayer & McKinney. Sybil's Gamboge blood featured the sale, fourteen of his get selling for an $864.33 average. Ten animals sired by his sons, Sybil's Gamboge 2d and 3d, were also included. Prices followed individuality, the very creditable Island productions apparently having but slight influence on the sale ring purse strings. Golden Cymbeline, taken with her two-day-old bull calf by S. A. Guy of Louisiana at the top appraisal of $10,000, is an eight-year-old without a test record herself and with hardly enough production behind her to draw heavy bidding. But she came into the sale ring in perfect exhibition shape, with all the excellencies of one seeking faultless conformation in a show cow. Mr. Guy paid $15,350 for four, including the $4,000 cow, Ben's Duchess, by Castor's Ben. Miss E. Fitzgibbons of Maryland secured the largest number, taking ten head averaging $785. Seven head fell to the bidding of J. F. Dorrance of the same state, the average price being $932. Twin Oaks Farm, New Jersey, secured the second highest priced animal, Melodant, at $4,500, and two others at $1400 and $1000.

A noteworthy factor in the success of Meridale's sale was the skill with which all the details which affect an auction were handled. The farms are beautifully situated in the foothills of the Catskills but are not readily accessible from railroads. This handicap in drawing a sale crowd was turned to a distinct advantage. Arrangement was made which brought four full Pullmans from the American Jersey Cattle Club annual meeting in New York City on the day preceding the sale. Fully one hundred persons were taken by automobile to the farms in time that ample opportunity was given for careful examination of the cattle to be sold. When Tom Dempsey and George Bain, manager and auctioneer, took the first bid the comfortable sale pavilion, initiated at the first sale, was filled to capacity and the buyers were ready to make the auction one of the best dairy cattle sales of the year.

Below are listed the animals selling for $1000 or more together with the names of their buyers:

Miss E. Fitzgibbons, Maryland	
Favorite Dot	$1000
Sybil's Flora	1500
Sybil's Sultane 2d	1500

Steady-going America

HERE is another case of sticking on the job. America set out some thirty-five years ago to be the best moderate-priced alarm on the market.

It has been kept busy ever since tending to the business that came its way.

America is just as lively today as it was the first day it stepped out to get a job. It has kept pace with every improvement from a time-keeping standpoint, but has refused to consider changes in body design that would increase its price without improving its quality.

It started out as a good value clock, one that runs on time, rings on time, and stays on time, in the regular Westclox way. And today it is one of the most popular clocks on the market. Be sure to look for Westclox on the dial.

Association Notes

Eureka, Wisconsin:—The condensery paid 45c per pound for fat during May, and the creamery paid 46c. Milk retailed for 8c per quart and butter for 34c per pound. Bran sold for $22 per ton; oats, $20—$25; hay, $10—$11; pasture, $1.50 per month.

Rock Prairie, Wisconsin:—Nine head went to the stock yards and 11 grade Guernseys were sold for dairy purposes and shipped to Illinois. One pure-bred Holstein bull was purchased. Market milk testing 3.5 per cent sold for $2.05 per cwt. during May. Four cents were paid for each point above. Milk retailed for 12c per quart; butter for 35c per pound, and cheese for 25c. Oil meal was priced at $42.50 per ton; bran, $30; corn, $20; oats, $30.

Effingham County, Illinois:—Four unprofitable cows were sold. In several herds production was increased approximately one hundred pounds milk and 6 to 10 pounds fat by feeding a grain mixture to cows on pasture. Market milk testing 3.5 per cent sold for $1.75 and $1.90 per cwt. during May. Three and four cents were paid for each point above. The creamery paid 27c per pound for fat. Milk retailed for 14c per quart; butter for 50c per pound and cottage cheese for 15c. Feed prices are as follows: Corn $20 per ton; bran, $25; oats, $28; oil meal, $49; cottonseed meal, $40; pasture, $2.00.

First Kane County, Illinois:—During the month, 41 unprofitable cows and 2 grade sires were sold. The annual meeting of this associaton will be held in June and a program is being arranged. Market milk testing 3.5 per cent sold for $2.05 per cwt. Four cents were paid for each point above.

Kane County No. 3, Illinois:—This is a new association just organized. The May price for 3.5 per cent milk was $1.85 per cwt. Feed prices: Corn, $22 per ton; bran, $22; ground oats, $22; barley, $25; cottonseed meal, $37; oil meal, $40.

Davenport, Iowa:—This association starts out on a new year in June. Last year the high cow, a grade Jersey 9 years old, was owned by C. J. Sheppard. She has a record of 479.3 lbs. of fat. During May, market milk testing 3.5 per cent sold for $3.25 per cwt. and 24c per gallon. The creamery paid 33c per pound for fat. Milk retailed for 12½c per quart and butter for 32c per pound Corn sold for $45 per ton; oats, $27; bran, $27; cottonseed meal, $36.

St. Louis & St. Charles County Missouri:—Two herds were milked three times daily. Four unprofitable cows were sold. Two more members started weighing milk and keeping daily milk record sheets. Some of the members in St. Charles County bought a carload of high grade yearling Holstein heifers and a pure-bred Holstein bull from Wisconsin. Milk testing 3.5 per cent sold for $3.02 per cwt. Five cents were paid for each point above. The creamery paid 27c per pound for fat. Milk retailed for 15c per quart and butter for 40c per pound. Alfalfa hay sold for $25 per ton; hominy feed, $25; crushed oats, $35; crushed barley, $36; gluten feed, $44; linseed oil meal, $45; cottonseed meal, $40; bran, $25; beet pulp, $38.

Southern Lake County, Indiana:—Nine cows passed out of existence by their inability to pay their board. One twelve-week-old bull was purchased from Wisconsin. Milk testing 3.5 per cent sold for $2.10 per cwt. during May. Four cents were paid for each point above. The creamery paid 35c per pound for fat. Milk retailed for 10c per quart; butter, 32c per pound; and cheese for 25c per pound. Corn sold for $15 per ton; oats, $20; alfalfa hay, $20; clover hay, $18; silage, $5; bran, $25; oil meal, $45; cottonseed meal, $40; gluten feed, $42.

Shelby County, Kentucky:—Most of the cows were on grass only, though a few of the men fed grain. Feed prices: Bran, $30 per ton; corn cob meal, $25; cottonseed meal, $40; white shorts $40. Milk retailed for 40c per gallon, and butterfat for about 21c per pound. All sires used in this association except one were registered.

Orange County, Virginia:—All members own pure-bred bulls. Several mix their own feeds now. A Farmers' Exchange handles all the feeds. Market milk testing 3.5 per cent sold for 28c per gallon during May. The creamery paid 42c—44c per pound for fat. Butter retailed for 50c per pound. Unicorn sold for $45 per ton; Eureka, $45; Purina, $58.

Whitehall, Wisconsin:—Ten calves were purchased for club work. The tester has been chosen club leader. Eighteen bushels of soy beans were shipped in. Sixteen registered Holstein females and 4 registered Holstein bulls were purchased.

Dallas County, Iowa:—During May, market milk testing 3.5 per cent sold for $2.45 per cwt. Five cents were paid for each point above. Alfalfa sold for $20 per ton; silage, $8; clover, $16; corn, $45; oats, $26;

bran, $30; oil meal, $48; cottonseed meal, $47.

Rome, Pennsylvania:—During May, market milk testing 3 per cent sold for $2.26 per cwt. Four cents were paid for each point above. The condensery paid 42c per pound for fat and the creamery, 40c per pound. Milk retailed for 13c per quart; butter for 30c per pound, and cheese for 28c. Prices of feed: Cottonseed meal, $2.35 per cwt.; gluten feed, $1.85; corn meal, $1.80; ground oats, $1.90; wheat bran, $1.60; oil meal, $2.60; middlings, $1.60.

Six Associations in Bradford County

Bradford County, Pennsylvania, now has six active cow testing associations operating on about one hundred and eighty different farms and testing monthly about 2,600 dairy cows. During the month just reported there were 328 cows that produced 40 lbs. or more of butterfat. The four high cows of that number are all pure-bred Holsteins.

The first in production is owned by H. C. Gates of the Canton Association. She produced 79.8 lbs. of butterfat. The second high cow is owned by Dent Hawthorne of the same association. Her record is 78.3 lbs. of butterfat. The third highest individual is also owned by H. C. Gates with a record of 76 lbs. of butterfat. The fourth high cow is owned by Walter Stanton of the Troy Association. She produced 75.1 lbs. of butterfat.

The Canton Association, which has been in active operation for almost eight years, leads the county with 120 cows to make 40 lbs. or more of butterfat. Of that number over one-half are registered cows. This association in its past years' work made an average yield per cow of 311 lbs. of fat, which is an increase of a little over 50 lbs. per cow above the average yield for its first year's work.

The outstanding feature of Bradford County Cow Testing Association work is that all of the high producing cows are pure-breds. In the eight years of continuous testing work over 15,000 cows have received yearly records of production. The highest producing individual of that number is a pure-bred Holstein owned by C. W. Newman. She produced 689.6 lbs. of butterfat.

The excellent results for this work have brought about a remarkable improvement and interest for better dairy cattle.

Pennsylvania. D. K. SLOAN.

Poorest Cow Proves the Best

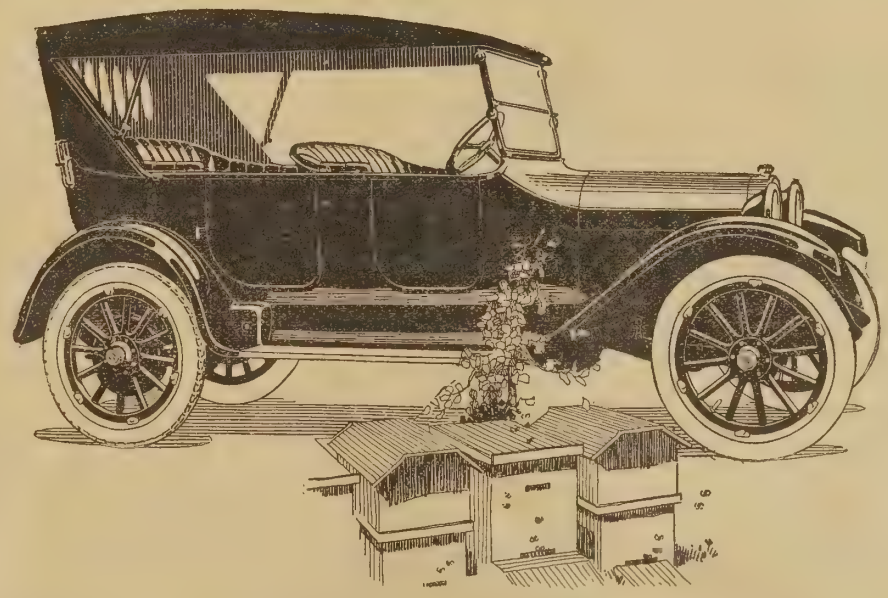
Although I have been keeping cows for the past eighteen years I never had any records or testing done until I joined the North Crandon, Wisconsin, Cow Testing Association. Since joining the association I have found that what I called the poorest cow turned out to be my best cow. Before joining the association I did not know that feeding would pay as well as it does. Now I am feeding one pound of ground feed to every three pounds of milk produced and find it has increased my net profit a great deal. It certainly would be a great loss to me now to have to drop the association work.

Wisconsin. P. A. STARKS.

Official Testing in Oregon

During April 106 herds were on test in Oregon. Of these 65 were Jerseys, 17 Guernseys, 16 Holsteins, 6 Ayrshires, and 2 Shorthorns. A total of 516 cows were tested.

A total of 520 tests were made, 505 being for two days, 11 for seven days, and 4 were ordered for retests.



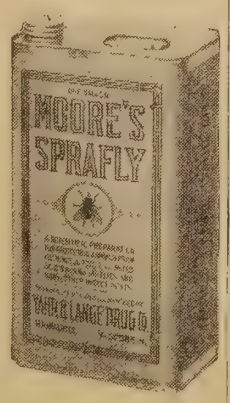
DODGE BROTHERS
MOTOR CAR

The distinguishing goodness of Dodge Brothers Motor Car is made evident in many ways

It asks the minimum of care and ordinary supplies, in order to return high value in economy and efficiency

Its reputation as a car that is more than ordinarily good is built wholly on the satisfaction its owners derive from its use

DODGE BROTHERS, DETROIT



MOORE'S SPRAFLY

Protects cattle and horses from flies. Allows them to feed in peace. Is easily applied with a sprayer. Saves double its cost in extra milk. An oily liquid, it spreads quickly, sticks fast, and goes far. Absolutely harmless, and satisfaction guaranteed.

Ask your dealer for MOORE'S SPRAFLY

Put up in 1-gal. cans only.

Yahr & Lange Drug Co
Milwaukee, Wisconsin

GENUINE CHAMPION Improves Milk Quality
Cools milk—removes odors—halts germ growth—stops waste and loss—saves its low cost in one week. If your dealer cannot supply you, write for free folder.
Champion Milk Cooler Co., Dept. D, Cortland, N.Y.

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

The Clean-Up

of stables, pig-pens, poultry houses, cellars, outbuildings, etc., can be done with less labor, in less time and with better results if you will use Carbola—the combined paint and disinfectant. It helps prevent the start and spread of contagious diseases that might wipe out your entire flock or herd. It makes your work easier. It increases the light in your buildings—makes them sweet-smelling—improves their appearance—puts them in shape to pass the inspection of milk companies or health authorities.

Poultry and livestock never produce their best in dark, dirty and gloomy living-quarters. The liberal use of Carbola means more dollars and cents in your pocket.

CARBOLA
The Disinfecting White Paint

s a white paint in powder form, combined with a disinfectant twenty times stronger than carbolic acid. Mix it with water and in a few minutes you have a smooth-flowing paint and a disinfectant that goes on the wall in one operation. It can be applied with a brush or spray pump to wood, brick, stone, cement, plasterboard, etc., or over whitewash. It will not clog the sprayer nor blister, flake or peel off. It is non-caustic and harmless to the smallest chick or stock that licks a painted surface.

Use It Instead of Whitewash and Disinfectants

where you have been using whitewash and disinfectants or just whitewash. One gallon covers 200 square feet, and it dries with a smooth finish. Use the dry powder as a louse powder on poultry, cattle, horses, hogs. You will find it excellent for this purpose and it costs only one-third as much as other brands.

Your hardware, seed, drug or paint dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express. Satisfaction or money back.

DAIRY MARKET NEWS

May Condensery Prices

Condensed milk market continues in draggy condition. Manufacturers of evaporated milk report that market conditions during the month of May have been less active than for the preceding month. The percentage of unsold stocks instead of being further reduced, as was the case the previous month, were increased approximately 44%. A decrease of 26% in unfilled orders was also reported. The brisk trade demands of the previous month seem to have subsided and trading was on a quieter basis. Prices of evaporated milk during May showed a slight decline but evidently were insufficient to attract buyers of large quantities, as they prefer to buy for immediate needs only, thereby being able to take advantage of frequent price declines. The range of prices was from $4.74 to $6 with an average of $5.57 or about 4c less per case than in April.

The market for sweetened condensed milk continues very quiet. Unsold stocks instead of being further decreased were increased nearly 50%, while unfilled orders remained at about the previous month's low mark. Prices of sweetened condensed case goods were slightly lower during April, the range being from $5.00 to $10.00 per case, with an average of $7.80 which was 17c per case less than the price for March.

Demand for bulk goods of both condensed and evaporated has been very limited. Warmer weather, although stimulating ice cream sales somewhat, has not as yet influenced the demand for bulk products.

The average price for the month of April for sweetened condensed whole milk, in bulk, was $11.98 per 100 lbs. with sweetened condensed skimmed selling at $7.11 per 100 lbs. These prices are slightly higher than for the previous month.

Exports of condensed milk during April were 6,500,000 lbs., or about one-fifth the exports for the same month during 1920.

The exports of evaporated milk during the same period were approximately 13,600,000 lbs., or about six million pounds less than for the same month during 1920.

Prices paid to producers for whole milk by firms manufacturing both bulk and case goods during May ranged from $1.50 to $2.80 per 100 pounds, the average price being $1.96, or over 2c per gallon less than the price paid in April. The average price paid by firms manufacturing bulk goods, only, was $2.13 per 100 lbs. during May compared with $2.29 in April.

The prices quoted in Table I are those paid producers for 3.5% milk delivered at factories during May. They are based on reports made by approximately 61% of the total factories in the U. S.

Table 1—Prices Paid Producers at Condenseries During May

Cheese Prices Steady to Firm

(Report by U. S. Bureau of Markets)

Cheese markets continued steady during the week ending June 4 but the active trading anticipated by dealers did not develop. The holiday on Monday cut into the market somewhat and the advance at country points which caused asking prices all around to tighten up was another factor. Buyers who were looking for low priced goods found that the tendency to make concessions had disappeared to a more or less degree. Of course the fact that current receipts in general must show more improvement in quality before active buying for storage purposes takes place, accounts to some extent for the light business during the week. This condition, however, should change materially in the near future, as weather and grass conditions in Wisconsin especially have been favorable for best quality.

The tone of the market at wholesale distributing centers indicated a fairly confident feeling, and higher country markets strengthened this feeling, although advances were not necessarily followed. Cheese sold at a retail price

DON'T PUT OFF

Seeing your friends and having them join in for a club of subscribers.

close to 20c as has occurred in some places has stimulated a good demand. Some export business took place during the week at New York at around 14½c.

The average wholesale prices on American cheese (style Twins) for the week ending June 4, 1921, and for the corresponding week a year ago were as follows:

	Week ending June 4 1921	1920
	cents	cents
New York	16.0	29.3
Chicago	14.7	26.1
Boston	16.0	31.0
San Francisco	14.3	25.4
Wisconsin	14.2	24.7

The receipts of cheese at these markets were 4,707,288 lbs. as compared with 4,581,518 lbs. a year ago, and 4,732,636 lbs. last week.

Butter Markets Held Firm

(Report by U. S. Bureau of Markets)

Chicago has been the firmest and most active market from a storage viewpoint all along but towards the close of the week a much more confident tone seemed to develop in the East and the supply of fine butter was less than the demand. Boston and New York both were storing freely by Thursday and taking the total into storage movement of the four eastern markets into account, the week showed gains of as much as 1,000,000 lbs.

Philadelphia and New York have both developed a considerable demand for sweet cream butter. Prices paid for this product average 2c to 3c above the regular 92-score quotation. There was also an active storage demand for fine, unsalted butter to be used for ice cream manufacturing later in the year.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending June 4, 1921, and the corresponding week a year ago were as follows:

	Week ending June 4 1921	1920
	cents	cents
New York	29.3	56.2
Chicago	28.8	52.9
Philadelphia	30.2	56.6
Boston	30.2	55.6
San Francisco	31.8	51.5

The receipts of butter at these markets were 15,962,655 lbs. as compared with 12,300,062 lbs. a year ago and 14,853,590 lbs. a week ago.

Butter Prices for May

The butter market for May showed a decline of nearly 15c from the April average. The closing price on butter ranged from 28½ to 30c a pound. The most serious decline since the first of the month is found in the eastern markets, where it amounts to approximately 7c, Chicago having felt the reaction prior to the close of April showing a reduction from the first to the last of May of only 2c. The total receipts for May are considerably in excess of what they were last year for the same month, as well as the total receipts since January 1st as compared with a like period during the past year.

The following table is compiled from the daily quotations of the U. S. Bureau of Markets and covers the average wholesale prices for May, 1920 and 1921, on 92-score butter (extras) as also the total receipts at these several markets:

	Av. price May 1921	May 1920	Receipts May 1021	May 1920
	Cts.	Cts.	Tubs	Tubs
Chicago	29.48	59.97	290,463	207,858
New York	31.88	61.48	284,521	163,610
Boston	32.37	61.28	107,260	77,384
Philadelphia	32.76	61.98	81,855	49,092
Total receipts			764,099	497,944
Receipts since Jan. 1			2,451,376	2,059,777

Ninety-score butter averaged 27.31c for May on the Chicago market with centralized butter at this market selling at 28.81c. Jobbers' prices on extras sold to retailers during May averaged 30.98c in Chicago and 34.64c in New York.

New York Butter Market

New York City, June 7:—Increased receipts, a strong active market, and advancing prices are now the order of the day in this market. No longer is there a feeling of uncertainty among receivers and there is no scarcity of buyers such as has obtained for the past several months. Practically all grades of butter are in active demand and all conditions favor the seller. Speculators feel that it is safe to store butter at present prices and are buying very freely. Practically a half million pounds of butter are passing into storage each day. Buying is not confined to the speculative element, but retailers are purchasing large quantities of butter, the chain stores are picking up all the butter they can find, and out-of-town buyers are either here in person or are ordering supplies by telephone. The conditions at present are ideal from the standpoint of the receiver and he is taking every advantage of them.

While receipts show a material increase over those of last year, the weekly increase at the present time is rather disappointing. It is very probable that consumptive demand in the interior of the country is very high and is absorbing a high percentage of the butter made in the producing areas. The lower prices for butter which prevail at present make it possible for consumers in moderate circumstances to buy butter for table use. There is less demand for substitutes throughout the country than has prevailed for several years. This market, however, is receiving butter from far away points from which very little butter was ever received before. Several car lots have been received of late from the state of Texas and from other southern states. Much of that butter shows undesirable characteristics, some of which are peculiar to southern made butter, but it is being absorbed readily although it is moving at prices considerably below the quotations for fancy northern made butter.

Another noticeable feature in the market at present is the arrival of great quantities of butter from the New England and North Atlantic states. A great percentage of the milk, which in former years was converted into condensed milk and similar products, is now being made into butter. Much of that butter is being shipped to this market. New York, however, is receiving less than its proportionate share of western butter, a condition which is

KIL-ZEM

Don't Be Pestered with Flies!

KIL-ZEM acts instantly. When applied with a fine fog sprayer it positively kills flies, fleas, lice, ticks, mosquitoes, bed bugs, cock roaches, and many other insect pests.

Kil-Zem protects all stock in barn or field from flies and other insect pests. It is non-inflammable: will not stain, mat the hair nor blister. Pleasant odor—will not taint milk. Prevents development of larvae when sprayed about farm buildings and stagnant water.

Kil-Zem has been proven superior to any other fly spray by many of the largest dairy farmers in Wisconsin and Minnesota. Approved by hundreds of herdsmen, and by Dairy Departments of State Experiment Stations.

Cows protected by Kil-Zem give more milk—young stock fattens more rapidly. Horses work better. Ask your neighbor—perhaps he uses it.

Sold direct to dairymen and other users in the following wholesale quantities, at prices named, f. o. b. Saint Paul:

In Barrels, (50 gallon steel drum included) ..... $1.30 per gal.
In Half Barrels, (30 gallon steel drum included) ..... 1.35 per gal.
In Quarter Barrels, (15 gallon steel drum included) ..... 1.40 per gal.
Special—2 gallon can, (sample order) ..... 1.50 per gal.

SEND NO MONEY—All shipments C. O D.

Our Kil-Zem booklet tells how to keep flies off your stock. Write for it—it's FREE.

Guaranteed to Do All We Claim for It

FREE!

To induce prompt ordering we will give absolutely FREE a heavy one-gallon galvanized air pressure sprayer with your first order for 15 gallons or more. Order today and get the benefit of this FREE offer.

After using one-fourth of the contents of any container in accordance with directions, any purchaser of Kil-Zem who does not find it superior to any fly spray he has ever used, as a fly killer and repellent, is authorized to return the balance to us for refund of total purchase price of the full container. That's fair—isn't it?

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Don't Worry

When It Storms

Your buildings and your lives are in no danger—no matter how near Lightning strikes—if you have Shinn-Flat protection.

Shinn-Flat

Lightning Rods Protect

The Shinn-Flat Conductor is the modern, scientific form of Lightning Rod. It is woven in a continuous flat cable of pure copper wires, one inch wide, with greater carrying capacity for electricity. Over 200,000 buildings in the United States and Canada, including many Government buildings, are already protected by the Shinn System.

Poultry Lice and Mites

The time of the year is at hand when we must fight poultry lice and mites, because during the warm summer weather they increase very rapidly. Everything should be done that will keep them in check if we want the poultry we are interested in to do well. No poultry club member will succeed who does not attend to this. Lice cause small chicks to remain small and they will always be stunted. Hens that are laying will cease to lay productively if they are infested with lice and mites. They will lose flesh and vigor and as soon as that happens, egg production will begin to drop off. While there are a great many kinds of lice and mites, it is quite common to classify those that are most troublesome to hens in three classes: head lice, body lice, and feather lice. They all are very similar in their habits, but the important thing about them is that they are all troublesome and birds that are infested with them are annoyed to a very great extent.

A JUNIOR POULTRY MAN WATCHES HIS FLOCK CLOSELY

Quite contrary to what many people think, lice do not suck the blood of the hen they are living upon. Their strong biting mouths enable them to bite into the skin and in so doing they live upon the skin and scales and the feathers. They can move about very rapidly over the body and it is very important to know that unlike mites, they never leave it so that when a hen is once infested with them they are always present unless some thing is done to get rid of them.

Body lice are very active and annoying when they are growing. They hatch from eggs in about a week and during the next twenty days they reach their full growth. They are a pale yellow color and are much larger than the common mites. They usually keep close to those parts of the body that are not well covered with feathers and hence they are found in greatest numbers under the wings and around the vent. The eggs are laid on the feathers down near the quill. On small chicks, they are sometimes found around the head and neck.

Feather lice are not considered as bad as the body kind for the reason that they spend their time on the feathers where they do all of their feeding. They are a little smaller than the body lice and they can usually be detected if the feathers of the breast are examined. They are not very common to young chicks, perhaps for the reason that the feeding grounds on them are not as well developed.

Direct treatment is the only remedy for these two kinds of lice. Whatever is used must be applied directly to the body of the fowl. The most effective remedies are classed as powders. Most any of the lice powders that are advertised are quite effective. One that is known as being very good is called sodium flourid. It is handled by many drug stores and it, too, is a powder. It is very effective because it is so poisonous to lice of all kinds. The birds that are to be treated should be dusted one at a time, because the effectiveness of the treatment depends upon getting the powder right next to the skin. The bird should be held so that it cannot flutter while it is being treated and then a small pinch of the powder should be dusted into the feathers and as close to the skin as possible. The best places to treat are under the wings, around the vent, on the breast, on the back, and about the head. Great care should be taken not to use too much on a single fowl, because too much might prove to be quite injurious. It is claimed by those who use this treatment that one pound of this powder should be sufficient to treat 100 birds. Care should also be taken not to allow the fowls to breathe sodium flourid as it is very irritating to the membranes of the respiratory system. Some poultry men recommend the use of blue ointment. If this is used it should be done very sparingly and about the only safe place to apply it is about the vent. A piece of ointment about the size of a good pea will be enough to use at any one time.

Head lice are very injurious to chicks. They stick close to the skin, on top of the head, underneath the bill, and on the sides of the head. They breed very rapidly and one infested chick or hen will pass them on to all others of the flock. Although they confine their attacks principally to the heads of chicks and mature fowls, they are also found on other parts of the body. Since they are very injurious, chicks at least should be examined quite frequently for their presence. The treatment which is considered very effective is rather simple and inexpensive. A small amount of melted lard or vaseline will do the work if applied to the top of the head, under the wings, and about the vent. Since any treatment for lice is simple and easily applied there should be little excuse for having much trouble with these pests.

The poultry mite presents quite another problem and any treatment to be effective must be followed up all during the summer. Mites live their lives in a different way. Instead of remaining on the bodies of the fowls, they only live there a portion of the time. During the day time, they are to be found inside the chicken house quarters where they try to hide in the crevices and cracks of the walls and roosts. At night when the birds are on the perches, they come out of their hiding places, crawl onto the bodies and begin to suck the blood. Before they are filled with blood they are gray in color and are then spoken of as gray mites. After they are filled with blood they appear to be red, and then are known as red mites. Their presence in large numbers causes the hens to lose flesh rapidly. Their wattles become pale and they soon begin to act sick. Since they do not live upon the bodies as do lice, body treatment would not be very effective in getting rid of them. The only way we can control them is to keep the housing quarters clean and we might just as well make our minds up to that, and the oftener the house is looked after, the more certain we may be that fewer mites are present. A systematic program should be followed. The thing to do is to give the house a thorough cleaning, including every thing in it. Then when it is as clean as it can be made, it should be most thoroughly sprayed with either coal tar preparations, crude oil, or kerosene. A hand spray will be found to do the work very effectively. And we should always keep this in mind. During warm weather, mites breed very rapidly and because one spraying will not kill all of them, it should be followed up with others every two or three weeks. There is no other way out of it if we want the flock to do well during the summer months.

Another good suggestion to all Junior poultry men is to use whitewash freely. This fills up the cracks and aids in killing them. A good wash may be made as follows: To a half peck of slaked lime add 20 gallons of water. Then add a pound of salt dissolved in water. After thoroughly mixing and before using, add two quarts of crude carbolic acid. This is a most efficient wash as it destroys the mites and their eggs as well, and besides the inside of the coop looks bright, fresh, and clean. The best way to apply the wash is with a hand spray as this is a clean and easy way to spread it.

Getting a Foothold

When the campaign was started for better live stock in Henry County, Ohio, two years ago, Mr. Arthur Palmer of Napoleon township became interested in spotted Poland-China hogs. Soon after he purchased a choice gilt, Mr. Palmer came to the office of the county agent and asked him to come out to the farm and see his new purchase. On this visit to the farm, the county agent became acquainted with a bright boy, John Palmer, who had just finished the 8th grade of the country school. The pig club work was discussed and John was invited to attend the pig club which the boys were getting ready to put on at the county fair.

About 26 pigs were being fed at that time in the boys' pig feeding contest. John and his father both became very much interested in the showing that the boys were making and John enrolled in the pig production club which the county agent was organizing at that time.

On the 15th day of December, John purchased a gilt from his father, paying him $35. The club committee of the township went to the farm and weighed the gilt and filled out the enrollment papers. The gilt was a spotted Poland.

During the winter months, John was a frequent visitor at the county agent's office, hunting for everything available that had anything to do with pig production. He gave the young sow the finest kind of attention. In the later part of March she farrowed six pigs. John was on the job. He had a good place for her. He had a good trough provided for feeding this sow and as soon as the pigs were old enough to run in the yard, he provided a clean separate runway for the sow and litter.

John knew what kind of feed to use and when and how to feed it. He had been getting this out of the club material.

When called on to discuss his club project at the township club meetings, John was all smiles, ready with a story about his sow and litter. At these township meetings the boys would talk with each other, exchanging ideas of how they were handling their project. John k t acquainted with his litter.

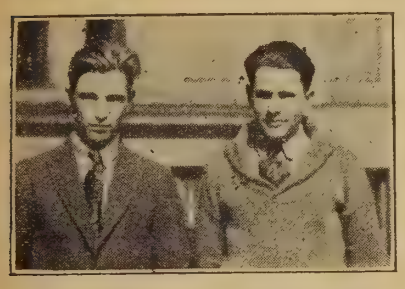
He gave the individual attention which makes the live stock business successful. By feeding shelled corn, ground oats, shorts, ground barley, tankage, and water, with alfalfa pasture, he had these pigs weighing 200 pounds at around 5 months of age.

John began to get them ready for the fair. He got them so that he could show them. He could move them about wherever he wanted to. When he unloaded them at the county fair it was easy to see that John must be somewhere up in the money. When his records were totaled, he was placed third in the placing of sow and litter and second in the winnings where record and everything were considered.

He sold the choice male pig for $10 more than he paid for the sow, realizing about $160 out of the rest of the litter and he kept the mother over.

This piece of education has been one of the finest things that could have happened to this boy. The interest in better hogs that his club awakened in his life is still a big feature in his work.

Farm families are overlooking a wonderful opportunity for the development of their boys and girls when they pass up the club work. Young men, when once started in live stock work of this character, become



JOHN PALMER AND THE LITTER HE RAISED

reliable, dependable farmers. Boys and girls soon became interested in what they learn to do well. If the farm families take pride in the industry of agriculture they should develop this interest in their children and through this interest perpetuate the family name on the old homestead.
